FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net while you Download Free Catalogs directly from my site. If you can't get my Catalogs that way, Feel free to Request catalogs by E-Mail. Really, it's not an inconvenience. I ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your full Mailing address so I can figure Shipping & Handling. I'll be back after the weekend. Bye!

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or atari@pacifier.com instead of NewsGroups as I am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this

message. I'm off for the weekend. But I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or atari@pacifier.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Bravo Sierra Computers has Moved! To a New ISP! Now Hosted on pacifier.com!!! Atari 8 Bit, ST and Jaguar Hardware/Accessories, Software/Games & References/ Books. FREE Catalogs on the web at http://www.pacifier.com/~atari or at Ben's SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received Through E-Mail at atari@pacifier.com or atari@benjamin.net and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

5370. lack of cable

Newsgroup: comp.sys.atari.st

FamilyNet Newsgate

Hello!

I> Thanks for the info, Andy.

It was the least I could do.

AB> I spotted a small phono-female F adaptor in a local
> store...

I> That's a whole lot of luck - I've never seen such
> adaptors in any stores here in Oslo.

It was fortunate, and saved me the cost of a new video
cable.

I> But if it's just the plug itself that's physically
> different, would it work just connecting a standard co
> -ax cable to the ST-phono with some random pieces of
> metal, wire etc. ?

I couldn't encourage you to do that, the picture quality
would suffer even more because your random wire won't have
the 75 Ohm impedance that the RF circuits of the ST and TV
are designed for. What are the local RF connectors where
you are? I may be able to obtain a suitable adaptor and
have it mailed it to you.

I> Well what about an amiga 1084-monitor? Surely it must
> have RGB.. ?

Yes, and RGB would be the preferred solution! Theoretically
it can provide better video than a composite cable, and will
certainly work better than an RF lead!

I> I read in a DIY scart-scheme that if you don't apply
> 150ohm resistors to the scart lead, the TV screen will
> "burn" because of ataris stronger-than-average signal.
> Or something like that.

Hmm... I guess that's possible. I do remember a very green
GEM desktop, but that could be changed in the control panel,
or by turning the brightness down on the TV. The resistors
are an interesting approach though.

I> God, my heart aches. Haven't used my atari in 8 months.

I know how that feels. Let's see if we can't get you sorted

If it is a bog standard Falcon then you may see this depending on the
bitrate of the file, look at the information for the file. Also not
having a CD clock fitted can slow things down. Try Falamp as on my Falcon
I can listen to internet radio online (although only 24kbit quality!)

It isn't switchable and it isn't possible to select as 110v. Cheapest
idea is to buy an inverter to step 110v up to 240v

For the ST, Turbo Assembler is definitly worth looking at. It is very
fast. However the most recent versions are only available in german as far
as I know.

Then you have the "Assemble" package which can be downloaded for free
these days. It is a GEM program, and also support 030/040/881 code, which
Turbo Assembler does not.

You can find both these at my webpage; http://www.dhs.nu/

Here I am replying to myself. I just remembered something. What Windoze does is not dithering. It is edge enhancing. Calamus does that with a module called Starscreening. Actually two modules, one more expensive than the other, one for much higher resolution files than the other.

With Calamus you can turn off this effect, if you get tired of it. With Windoze you cannot.

Source record: 47166
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Greetings all!

Well, I have put my TT030 to good use, installed Linux on it, wrote a new BBS program for it and connected it to the net.

Check it out by telnetting to jybolac.dyndns.org on port 520. Here is the URL as well: telnet://jybolac.dyndns.org:520. You will be logging in to my TT directly.

If you would like to join the BBS, log in as user 'new'. I am still working on several of the features, like allowing the user to define preferences and menu styles, but I would like to open it up to everyone. And, all comments and suggestions are welcome. Since I wrote the software myself, I can change anything easily. I am hoping that the software will work under MiNT as well as Linux, but that has not been tested yet as I don't have MiNT.

Thanks,
Chris

> regardless of the drive that is connected.

That's disappointing for SCSI, but it's nice that the drive will work even on the slower bus. In the case described, would the cable length be limited to 1.5m (what my notes tell me single-ended Ultra SCSI can cope with), or does the slower speed of the Falcon SCSI bus mean that it can be extended to 6m (as per 5MHz single-ended narrow SCSI)? Is the Falcon SCSI bus asynchronous only? Would devices be able to talk to each other at higher speeds, with just Falcon limited to 1.8Mb/S? Do you happen to know how fast the TT SCSI bus will run? Sorry to bombard you with questions like this, but I am very interested in understanding Atari SCSI.

It's co-ax. And thank you very much for the offer. But it is no longer necessary, cause the problem is solved. Following Lyndon's advice, I simply stuffed the co-ax into the ST RCA port, and whaddayaknow, it worked!

<blush> After all this time, it really was that simple. I think I considered it briefly once, but didn't have the co-ax cable within reach, and dismissed the thought.

> Yes, and RGB would be the preferred solution! Theoretically
> it can provide better video than a composite cable, and will
> certainly work better than an RF lead!

Yes, the RF process really degrades the picture quality. I noticed that the 1084 has a separate RGB-connector which looks exactly like the one on the back of the ST. Could I use that one for input to the monitor? That would be nice, because - well, I may as well admit, there's an amiga wanting to use the scart connector on the monitor.

> Hmm... I guess that's possible. I do remember a very green
> GEM desktop, but that could be changed in the control panel,

It's back online now - once again my soul is complete. But still, that RGB thing sounds a bit of allright.

Oh, something else. I want to open the machine up, to check if the ram is in sockets or soldered, board revision, repair mouse/joystick ports and a number of other reasons. I've never opened one before - is there anything I should know about opening it up, so as to not destroy anything?

You're the man, Andy.

It's likely that the socketed chips will need that reseating, due to
oxidation, and they may have even physically popped up due to the
heat/cold cycling. I'd also try reseating all the cable connectors
and power supply connectors.

In particular, the memory SIMMs may need to have their contacts
cleaned. In the STE, most of the LSI chips are surface mounted, so
there shouldn't be a problem with the CPU, but you may need to remove
the TOS ROMs and clean their legs too.

Be gentle and ground yourself before touching the chips. You can use
a hard eraser (an "ink" eraser, or "typewriter" eraser if you can find
one, they're usually hard and white) to clean the contacts. Just use
a pencil eraser if you don't have the other kind. Wipe the contacts
clean with a paper towel after rubbing them with the eraser.

If you have a voltmeter, check the voltage across the +5 volt supply,
(usually the Red wire) to ground (the black wire), make sure it is
very close to 5.0 volts, or just a little less.

Try setting the voltmeter to its lowest AC voltage setting and measure
across the +5v DC supply. The lowest setting may not be sensitive
enough (depending on the meter), but you ideally want to read 0 volts
AC across the DC supply. If you read any appreciable AC, usually
coupled with an abnormally low DC reading, it usually will indicate a
bad filter capacitor in the power supply (the "dry" capacitor of the
other reply).

Be careful if you decide to try poking around in the STE with the
power on, as there is LETHAL voltage present when the unit is plugged

into the wall socket.

Also, sadly, be aware that any repairs may be expensive, possibly more than the unit is worth. Check prices at Ebay in the Vintage Computers category for a replacement STE before deciding how much you want to spend on getting this one fixed, just in case reseating the chips doesn't help.

Good Luck!

BobR

Right, undo all the screws that have a square shape around them, there are
3 at the front and 4 at the back. DON'T undo the ones directly under the
floppy drive. Remove any disks in the drive and then lift the left hand
side first then the right as you slide it over the eject button. Undo the
shielding screws and un-twist the metal tabs. Simple really.

BTW don't pull the keyboard up, remeber to disconnect the mouse/joystick
and there is a short connecting lead from thwe keyboard to the mobo
inside. Carefully undo this (don't just pull at the wires) and move to
one side. Be carful of the PSU as this still holds potential voltage
levels!

Hmmm, I'll see if I can find that.

I've managed to convert my MP3 to AVR as well, and that is in stereo.

Sorry, but wat is a CT 2 falcon, or what is different about it?

After 8 Years of Atari abstinence I did install MiNT, and found it not too complicated. I talk just about hte kernel without any drivers running in the STonX emulator. the next step I find harder, and it would be godd, if there would be a (possibly) graficle basic setup for the basic commands and things around (creating dirs and links and all this stuff). But the documentation is quite well.

I gave that a try tonight and things didn't turn out very nice.
DTR was highlighted for Ser2.LAN so I switched it off. The modem was
still showing online in CixComm.

Also, now when I try to set Modem 2 in Serial.cpx I get a crash from
ZControl. B^<

If that's the case, I'll need to set STinG up completely with all the
appropriate settings in all the CPX's, SCR and INF files. I was hoping
to avoid this by just testing it with a bare terminal, but it looks
like I have no choice but do the lot all at once. B^<

Hi Ken, when I first bought my SyJet it would randomly eject the cartridge. I found a fix from reading the alt.syquest newsgroup. It involves removing the plastic case and taking a file to the back of the eject button; which slightly shortens the length of the button. I did this on my unit a couple of years ago and had no more problems.

If you've had your unit for long time and am just now experiencing this problem, I would try to pull the eject button forward (this assumes that the button has become "sticky" and is giving the SyJet false signals).

6 m should be possible, but I'm not absolutely sure. The Falcon's (and
TT's) bus is asynchronous only, with the TT being sligthly faster than
the Falcon. If the Falcon is not involved devices can speak to each
other with higher speeds. But most likely this is not relevant since the
Falcon is the only initiator in most cases.

I have two standard Mega STEs, both for music.

I ran Notator back in 1992-94 then switched to Cubase.

I will answer only the questions I have experience of.

> a) 8/16MHz vs. 8MHz speed
> "Notator SL" which I'm using for MIDI sequencing can only run at 8MHz
> anyway, but does the 16MHz mode really make it such a faster machine for
> applications which can handle it? Is it worth having?

Yes. Strangely, Steinberg 'Speedup' works too.

> b) 16 Kbyte cache
> I take it this also improves the speed, but does it make a big change?
> Again, Notator SL needs to have this switched off, so it's only useful
> for other applications in my case.

I left it switched on......

> So all in all, what do you suggest I do?

Bin the Seagate 48mb drive and fit a quieter one.
The mobo is 460mm wide, won't go inside a standard rack case, or my ST rack
case.
Can't see the point of recasing it. The lift out HD carrier is very useful.
The Unitors hook into the standard case.
The Mega STE runs Notator, works well enough as it is.
Leave it alone for music and modify another ST for other uses.

Barrie at Keychange.

>
Bloody hell yes!!! The MegaSTE is best regarded as the ST version of the
Falcon/TT. I do remember seeing a demo of Notator on a MegaSTE video that
was done by the Notator crowd, I had assumed it would run full pelt on a
MeagSTE, as it appeared to be quite quick on the tape. But the clock speed
alone is only about a 40% speed improvement.. See next point.

> b) 16 Kbyte cache
> I take it this also improves the speed, but does it make a big change?
> Again, Notator SL needs to have this switched off, so it's only useful
> for other applications in my case.
>
Bloody hell yes!!! The cache will further improve the speed upto 2 times as
fast as an STE, As above I had assumed notator will work eith Cache and
16Mhz?? Any one know for sure? Also note that the cache can ONLY be enabled
at 16Mhz..

> c) possibility to add a 68881/68882 co-processor.

>

Again not really, in theory it would be great as you could see more on the screen, but I don't know if Notator can use it or not. Depends on how clean it is.

> so).
>
The MegaSTE has THREE ports and a LAN port which is also a modem port RS422. The first port is the same as the STEs port 19,200 only. The next 2 are high speed upto 230K in fact, as is the Lan. However don't expect much more than 58k as the systems cpu is not really capable of running the ports at top speed AFIK. I used to set the serial 2 to modem and serial 3 to Ghostlink, it worked a treat.

> In addition to this I also have this "RSVE" circuit which will connect
> to the standard STe modem port making it possible to use higher speed

> Not sure if the speed limit is 38400 or 115200 baud.
>
Speed limit is 38k, unless your STE has veloce or something like that. You can use RSVE to speed up the modem1 port on the megaSTE, so you get another 56k port.

> My question to all of this: with the mentioned hardware solutions: what

In theory yes, see above re LAN port. There is no way of using RS422 on an STE, AFIK.

> If yes, is there a way to do this with extra hardware in the STe?
>
> So all in all, what do you suggest I do?

Get the Mega, if notator only runs a 8MHz then who cares. You can still run it at this speed when you run Notator, then kick it up when you run well written software;-).

Megas rule

Yes I seem to recall reading the review in AC. I'll check this out (I think it's on the AC CD) but Lonny has already sent me a CPX which is fine, apart from the buggy interface (on my system anyway).

Thanks

Notator runs fine at 16MHz, if you disable the CPU cache in the
General CPX.

> does the 16MHz mode really make it such a faster machine for
> applications which can handle it? Is it worth having?

It _is_ worth it.

> c) possibility to add a 68881/68882 co-processor.

Exactly.

> e) Two modem ports
> I'm a little confused here as the specs I've found don't say anything

See TT FAQ at the URL below.

> f) High-speed serial port or LAN port.
> What does this mean? Is there a switch on the back of the machine where
> you choose to use it as either a third modem port, or as a LAN port?

The selection is made by software (one spare bit on the Yamaha
chip) and defaults to the LAN port at bootup. Changing that bit
selcts Serial2 instead.

> And what can the LAN port be used for? Are there any practical
> applications for this? Could I for example connect my Apple Mac and the
> Mega STe together to transfer data between them?

Precisely. Using an old Mac printer cable as a null-modem, plus
either terminal software or TCP/IP e.g. STiNG.

> So all in all, what do you suggest I do?

Go for the MEGA-STe, if you still can find one.

I don't think the Mega I sold you have any problems with the cartridge
port, as I used a Vidi ST on that machine quite a lot.

> a) 8/16MHz vs. 8MHz speed
> "Notator SL" which I'm using for MIDI sequencing can only run at 8MHz
> anyway, but does the 16MHz mode really make it such a faster machine for
> applications which can handle it? Is it worth having?

Yes, it's definitely worth having. The cache makes the MSTe twice as fast
as the STe when doing CPU-intensive-stuff like (un)packing, compiling etc.

> b) 16 Kbyte cache
> I take it this also improves the speed, but does it make a big change?

See above.

> c) possibility to add a 68881/68882 co-processor.
> What is this actually used for? I guess that the software needs specific
> support for this processor? What kind of software is it useful for?
> Number crunching applications perhaps?

The most common use of the FPU is for ray-tracing and similar operations.
There might be some sample-editors that can benefit from an FPU, but I
suspect that these are compiled for the 030. Check the apps you're using.

[VME graphics card]
> But if I was to use such a card, what kind of applications would support
> it?

All apps that use the AES/VDI correctly. I believe this excludes most
older MIDI-software.

The VME port is not just for graphics cards though, you can use network
cards as well. I happen to have a VME ethernet-card with a driver that
only works on the MSTe, you can have this pretty cheap if youï¿½'re
interested.

> e) Two modem ports
> I'm a little confused here as the specs I've found don't say anything
> about what kind of serial ports are used on the Mega STe. Speed? Port

The MSTe has a SCC in addition to the MFP. It has the same MFP-driven
serial-port you find in all STs, as well as two RS232-ports and a LAN-port

driven by the SCC. You'll have to select between the LAN-port and one of the serial-ports in software.

> My question to all of this: with the mentioned hardware solutions: what
> will the differences be to a Mega STe?

The main difference would be that the MSTe would still be pretty standard and unmodified, while you have to spend a lot of time and effort on the STe. The MSTe is very reliable too, perhaps more reliable than a tricked-out STe.

> f) High-speed serial port or LAN port.
> What does this mean? Is there a switch on the back of the machine where
> you choose to use it as either a third modem port, or as a LAN port?

No, this is controlled by software.

> And what can the LAN port be used for? Are there any practical
> applications for this? Could I for example connect my Apple Mac and the
> Mega STe together to transfer data between them?

Yes, if you can run PPP over the Mac's LAN-port, you can use STiNG and a Mac printer-cable as a nullmodem-cable between the MSTe and Mac.

> If yes, is there a way to do this with extra hardware in the STe?

A RS422<->RS232 cable (i.e. any Mac-to-modem cable) can be modified to do the exact same thing.

> So all in all, what do you suggest I do?

If the alternative to a MSTe is a STe with a lot of extra hardware, just get the MSTe. The keyboard is great too.

>case, I've ticked the Sound Only option. I can understand a humble

If you have a normal Falcon, and you want listen all MP3 without
repeats, you need to:

- Set the D2D buffer to 5 seconds (sound configuration box).
- Decrease the screen resolution or numbers of colors (Videl & ST-RAM
slow down the computer).
- Increase the Timeslice under MagiC & MiNT.
- or buy a CT60 ;-)

If you have a TT, I havn't good solutions. Without DSP, only an
Hades 060 can listen all MP3 without repeating.

>Atari not being able to decompress MPEG's in real time, but are MP3's
>so complicated too? Is there any option in Aniplay that will allow

Yes MP3 are more complicated to decompress than MPEG video track.
But the DSP is a good MP3 solution for Atari computers.

>MP3's to be played?
>
>I have converted an MP3 file to a WAV file (by using the Save option,
>and it took an hour) and it plays that fine. Although it doesn't seem

An hour ? What is your computer ?

>to be in stereo. Are WAVs mono only? Or perhaps the original MP3
>wasn't stereo.

Without DSP there are an option for force in mono (in the Sound
Configuration Box).
You can see if your file is in stereo with CTRL-I.

Regards,

Didier.

Some programming languages and GFA-Basic programs compiled using Licom use
the co-pro.

> If yes, is there a way to do this with extra hardware in the STe?
>
You can add extra hardware to the STe but the all-in-one solution of the
MegaSTe is IMO better and more reliable.

Greetings,
Matthias

Thanks for the info - I'll try that. I have certainly played around
with all the options but thre are millions of combinations! I'm using
Eclipse (1024x768 true colour) but the Falcon video itself is set to
640x480 monochrome.

>- or buy a CT60 ;-)

Erm...

>Yes MP3 are more complicated to decompress than MPEG video track.

That's really surprising!

Standard Falcon. However the MP3 was 5MB!

>Without DSP there are an option for force in mono (in the Sound
>Configuration Box).

I think that may have been on. Anyway, I've converted the file to AVR
now and that is all I need.

I though about shaving the ground plane off, but I needed about 10mm and
that's far too much. It's there for a puropse anyway.
If you want the machine to be reliable and stable, then this isn't the way
to go unless done properly.

The standard STE will fit in my rack case, no shaving.

> >There are always ways around things like this.

Not with the Mega STE, there are components all round the edge. A standard
rack case is about 420mm wide, my rack case is 440mm wide, just fits between
a flight case rails but at 460mm the Mega STE mobo
is just too wide to modify.

I was wondering if someone would explain the 50Hz/60Hz video on the
STE. I am not a very "high tech" atari user, but I am using my
revived STE for most everything now (internet, etc.), and having a great time with it.
I have found that there are several programs that will cause the video
to scroll, unless I use a 60Hz patch, but this does not work for all
programs. I haven't been able to find a lot of information on this.

Thanks,
Joseph D. Place

I've done some experimentation with Notator SL and the 16mHz things. My 1040 STe has the ICD AdSpeed chip in it. Notator runs at 16 or 8 in that unit, but the ICD QuickST 2.2 (in the AUTO folder) must be disabled.

In a Mega STe it will run at 16 mHz and you can enable the cache after running NOTATOR, using the CPX feature. But WCOLORS.CPX must be disabled in any event.

I'm typing this on an old Mega ST with the TOS 1.02. It runs Notator OK, but it wn't run Calamus SL! My TT is in the same room, however.

Hello to Hallvard in Norway! It's been ages since we corresponded.

I had gotten 2 MEGA STe's for friends and loaded them with software.
Now the program that you speak of should be able to run in 16MHZ with
cache on. If it does not you can always slow it down!!! But most
other software that I noticed did run alot faster. It does not seam
like 8 MHZ. would make that much difference but with a cache and
doubling the clock speed it made one heck of difference.

>
>b) 16 Kbyte cache

>But if I was to use such a card, what kind of applications would support
>it?

You are correct and MARIO is working on getting the card to work more
efficiently on the MEGA STe. But most software is written to seperate
itself with video actions. And the resolution for CAB and internet

browsing not mention allowing 65536 colors with 32 bit color is
amazing on a machine like that. The resolution is set at optimum
level which is 1280X1024 can go higher or lower. My brothers 500MHz
DELL was set at 1024X768 and he had a picture of his wife as a wall
paper and it looked just fine so this resolution is amazing as well
coming from a machine like that not mention it has 4MB of video RAM or
an optional 16MB card as well!!!! Other than that I do not know of
anything else that goes into the VME!!!!

>
>e) Two modem ports
>I'm a little confused here as the specs I've found don't say anything
>about what kind of serial ports are used on the Mega STe. Speed? Port

You can connect a serial mouse from a PC into the modem port. That is
why they included more ports on the MEGA STe and TT030 and FALCON.
Because cheaper mice were being made. But you do need a special
driver that must be put into the auto folder when booting to be able
to use PC mouse throught the modem port 1 or 2!!!

I think modem 1 and 2 run at 19200 and serial2/LAN port runs at
115200.

>I've already gotten hold of an "ST_ESSC" board which gives me an

>will the differences be to a Mega STe?

The Mega STe is a very indestructible machine. Not to say the STe is
not but the MEGA's came from holland to the USA and worked just great
when they got here!!!!

>
>f) High-speed serial port or LAN port.

>And what can the LAN port be used for? Are there any practical
>applications for this? Could I for example connect my Apple Mac and the

>Mega STe together to transfer data between them?

The serial 2 port allows for 56K connections to the internet. LAN port is built into the serial 2 port and allows for a network of computers to be hooked together. See the modem ports can be used for other things as explained earlier. For example the modem 1 can have a PC mouse hooked into with the right software!!!! Yes you can network many atari's together or maybe with the right software you can network other computers like the PC or MAC!!!! I dont know if there is software out there but I would not be surprised if there was not something out there to do what you want!!!!

It is highly possible to hook the MAC and MEGA STe with the right connection and software!!!!

>
>If yes, is there a way to do this with extra hardware in the STe?
>
>So all in all, what do you suggest I do?

I think the MEGA STe is a better choice especially if you are going to do more than just MIDI with it!!! There are also RCA jacks on the back of the MEGA STe that some nice sounding powered speakers can be hooked to it!!!! All in all it is your call but you would not have to hack on the MEGA STe to do all the stuff you want. But with the STe you have to do alot of hacking to get it to do half of what the MEGA can already do in stock form!!!!!

Not to mention the MEGA STe can have 4 MEGS of RAM really easy and that is needed for doing MIDI very well!!!

The MegaSTE has three serial rs232c and 1 rs422 port. They are labelled
modem1, modem2 and serial 2 they are asynchronous, which means they can be
run concurrently. Have to keep it short as my daughter is anoyed with me;-).
The Lan port is synchronus with serial 2 which means you cant use it while
using that port. You can also use a megaSTE to connect to 3 PCs at once
using ghost link. Never tried it but it should work. And remember always
stick to 58k, to avoid retrains etc...

>case, I've ticked the Sound Only option. I can understand a humble

If you have a normal Falcon, and you want listen all MP3 without
repeats, you need to:

- Set the D2D buffer to 5 seconds (sound configuration box).
- Decrease the screen resolution or numbers of colors (Videl & ST-RAM
slow down the computer).
- Increase the Timeslice under MagiC & MiNT.
- or buy a CT60 ;-)

If you have a TT, I havn't good solutions. Without DSP, only an
Hades 060 can listen all MP3 without repeating.

>Atari not being able to decompress MPEG's in real time, but are MP3's
>so complicated too? Is there any option in Aniplay that will allow

Yes MP3 are more complicated to decompress than MPEG video track.
But the DSP is a good MP3 solution for Atari computers.

>MP3's to be played?
>
>I have converted an MP3 file to a WAV file (by using the Save option,
>and it took an hour) and it plays that fine. Although it doesn't seem

An hour ? What is your computer ?

>to be in stereo. Are WAVs mono only? Or perhaps the original MP3
>wasn't stereo.

Without DSP there are an option for force in mono (in the Sound
Configuration Box).
You can see if your file is in stereo with CTRL-I.

There is no serial3. Please see the TT030 FAQ below. TT speeds
are slightly diffenret than MEGA-STE speeds, but otherwise this
is the same naming scheme:

Modem1 19200 (like ordinary ST)
Modem2 115200
Serial2/LAN 230400 (boots to select LAN by default)

Source record: 47065

Hi.

I recently bought a second hand Atari Falcon 030, with loads of equipment.

Among the programs that came with it, was Calamus 98 SL (or something similar). It's a nice program, which I would like to use a lot more.

However, I have no way of outputting stuff from it; I don't have a suitable printer-driver for it. In other words, I need a printer-driver for my Star LC-10. Does anyone know where I can get one?

As an alternative, can I "print" to Postscript or PDF-files instead, and then print them out using my Windows-based computer? (This would be a preferred solution, in fact, since I could occasionally my friends ink-based printers instead of my old, noisy but reliable dot-matrix printer.)

I know very little about Atari-computers, so please keep your replies on an understandable, not-too technical level. :-)

If you intend to process samples on the ST, the extra speed would be nice
I guess. But for pure midi-applications it's probably of little use.

> So, what does this mean? I surely wouldn't see things differently
> through the VME video card than the standard ST video output with an
> SM-124/125/144?

Most graphics cards supports 16 and 24 bit colour, as well as resolutions
up to 1600x1200. Depending on their design they'll also be a lot faster
than the shifter, a good graphics card should be 10-20 times faster. This
does not apply to my ET4000-based Crazy Dots though, which isn't much
faster than a stock TT.

> Thanks, but doesn't the LAN port handle this sort of thing?

No, the LAN-port is nothing more than a serial port. There is no AppleTalk
impementation on the Atari, so the only way to hook it up to your Mac is
to use a nullmodem cable (old Mac printer cable) and set up a PPP or SLIP
connection.

>> The MSTe has a SCC in addition to the MFP. It has the same MFP-driven
>> serial-port you find in all STs, as well as two RS232-ports and a LAN-port
>> driven by the SCC. You'll have to select between the LAN-port and one of
>> the serial-ports in software.

> So basically I'll have the same setup (minus the LAN port) when having
> "ST-ESSC" installed in my STe or Mega ST then?

Probably. I'm not familiar with this hardware.

> As for the harddisk/CD-ROM I've planned to use IDE solutions as I got
> that IDE interface with your Mega ST, but this can't be used with an STe
> of course, so I was wondering about having an internal SCSI harddisk and

You can connect this IDE adapter to a STe with some time and lots of wire,
but it's easier to buy Mario's IDE-interface. It's cheap, well designed,
compact and incredibly easy to install. I installed one in a 4Mb STe, and
managed to fit a standard 3.5" drive between the floppy and PSU. Works
very well and doesn't overheat.

> I'm thinking about using the same adapter for having the two internal
> devices, then have a connector for any additional external SCSI devices

> -this should probably work fine through the usual SCSI daisy-chaining,
> but the issue about termination is a problem.
> I mean, I don't want to keep plugging/unplugging a terminator each time
> I connect/disconnect an external device to the computer. I've heard

Just buy a simple external terminator and plug it in when the external
devices are disconnected. These terminators just looks like a SCSI
connector and cost next to nothing.

>> The MSTe is very reliable too, perhaps more reliable than a
>> tricked-out STe.

> What's unreliable about the STe, and what makes the Mega STe more

The STe isn't unreliable, but lots of modifications may change this.

>> Yes, if you can run PPP over the Mac's LAN-port, you can use STiNG and a
>> Mac printer-cable as a nullmodem-cable between the MSTe and Mac.

> Hey, that's great! But wouldn't this even be possible using one of the
> serial ports (i.e. "modem-2" or "serial-2" of the ST-ESSC hardware)?

Sure, but you'll need a RS232<->RS422 converter cable.

> Falcon is not involved devices can speak to each other
> with higher speeds. But most likely this is not
> relevant since the Falcon is the only initiator in
> most cases.

That's a good point, and probably true for the vast majority of Atari applications.

I remember seeing a demonstration where a SCSI drive (I /think/ it was a Zip drive), a hardware MPEG decoder and a (non-Atari) host computer were on the same SCSI bus. The way it was explained to me, the disk was instructed to send a stream of data to the MPEG decoder, which would then render it on an S-Video output. This was some time ago, but I believe I was told it would work without the computer. I'm guessing there was a computer in the MPEG decoder that could request the data from the drive.

If the computer instructed the drive to send data to the decoder, would the drive and decoder then get on with the job without further action required by the computer? If the computer had a slow SCSI implementation like the Falcon, would the drive and decoder communicate at a higher (perhaps synchronous) rate? I don't anticipate trying this on an Atari anytime soon, but would like to understand the implications of putting an Atari on a SCSI bus.

If the decoder would work without a (separate) computer on the bus, would the decoder be acting as an initiator? What other kinds of devices act as initiators?

Thanks,
- Andy.

> STE.

50/60hz refresh rate is set at address 0xFFFF820A, bit 1.
bit 1 = 0 for 50hz
bit 1 = 1 for 60hz

> I have found that there are several programs that will cause
> the video to scroll, unless I use a 60Hz patch.

Hum, GEM programs do not change it, only games and demo
set it for their needs. If your video is scrolling, it means your monitor
does not support one of the frequency. Recent TV support both rates.

>(and need to have it work reliably!).

Hmm, how complicated was the vocoder ciruit. Not much probably as it is
analogue. The ST may be old but it is doublesided board and has many small
tracks. Yes it is possible but it won't look nice and it may be difficult
to find a place where to cut a straight line as chips may get in the way.

Hi, Hallvard;

>But there's still the issue with DMA sound which is pretty important.

You referred to this earlier concerning your need for sample playback.
To make this ability complete you would probably need a sampler too-
which the Mega STe doesn't have. However, a cartridge-port A/D convertor
should be so simple that I suppose someone has already made it and maybe
you can find it. Probably it would be better (i.e. faster) than a
serial-port sampler which you mention.

Be aware that DMA-playback in a MegaSTE is still with only 8-bit resolution,
i.e. not very good.

>> > c) possibility to add a 68881/68882 co-processor.
>Yes, I believe some of the sample editors around support this.

If you know of any which do, please, let me know (I have a 68881 installed).

>> The VME port is not just for graphics cards though, you can use network
>> cards as well. I happen to have a VME ethernet-card with a driver that
>> only works on the MSTe,
>Thanks, but doesn't the LAN port handle this sort of thing?

Ah, but the LAN port in a MegaSTe is NOT an ethernet port, but a more-less
standard serial port (I think it complies with RS-422, not RS-232).

>I was wondering about having an internal SCSI harddisk and
>CD-ROM instead as I actually have two SCSI adapters: GeSoft's adapter
>and ICD's Link II. I'll be building a parity generator for the GeSoft
>adapter.

I have a GeSoft SCSI adapter and it DOES HAVE a parity generator. Maybe
your unit has it too- check: it is a standard (74280, I think) TTL chip.
Anyway, isn't Link II a better one to use?

>I'm thinking about using the same adapter for having the two internal
>devices, then have a connector for any additional external SCSI devices
>-this should probably work fine through the usual SCSI daisy-chaining,
>but the issue about termination is a problem.

It should work fine, but why would termination be a problem, so long as you
terminte only the last device? In your case this should mean that all
internal devices should not be terminated, any external device (I suppose
you wll connect one at a time) should be terminated, and if no external
device is connected there should be a terminator in the connector.

>I mean, I don't want to keep plugging/unplugging a terminator each time
>I connect/disconnect an external device to the computer.

Why not? You just push it into a connector like a plug from any other device.
Besides, it keeps the connector pins free from dust and accidental
short-circuits. In order to securely connect an external device you would,
anyway, have to secure its cable somehow (with catches on a Centronics-type
SCSI connector, or with screws on a D-25), so you would have to meddle
around the back of your computer to do it. A little extra effort needed
to pull out the terminator first doesn't seem significant to me.

>> If the alternative to a MSTe is a STe with a lot of extra hardware, just
>> get the MSTe. The keyboard is great too.
>
>Well, the keyboard is solved by using Mario Becroft's "QWERTYX" (PC
>mouse/keyboard interface) and a standard PC keyboard and as mentioned

If you use the Cherry keyboard from your MegaST (or if your hypothetical
MegaSTe come with one like that and not with a standard MegaSTe keyboard)
it would probably be better than most PC keyboards you can find- and about
as compatible as you can get. This MegaST Cherry keyboard is among the best
I have ever used.

> Rack case

How important is it to actually mount the thing in a 19" rack case?
Do you already have a rack with other equipment and want to push the
computer in? If it is just a matter of putting the computer in a larger
case so that all additional equipment can fit, maybe you can consider
another solution: large desktop cases of early PC ATs or even XTs can be
found for nothing and seem to be of about the right size and gray colour.
And they were built like armoured cars- very stiff and secure, made of
thick metal sheet and therfore with excellent electromagnetic shielding.
I suppose that a MegaSTe board can fit in. It may be just a matter of
changing the front face, and maybe not even that. I once toyed with an idea
of putting my MegaST, hard disk, modem, etc. in such a case, and finding the
plastic case of a dead 520ST from which I would cut the part with slanted
grilles and install it as the front of the PC case to get an "Atari" look
together with the Atari logo. Another part of the idea was to make a
drawer-like compartment in the lower part of the case (it is high enough)
so that Mega's keyboard could be tucked inside the case to make room on
the table when it would be needed, and to keep the keyboard free of dust.

This was jus my design fancy and never got materialized.

Cu.

What I would do is what I did. I got NVDI 5 and then got the VDI module
for Calamus. Now all the printer drivers that work with NVDI work with
Calamus. You could also check out the Inverse website and see if they
have a printer driver there for it.

http://www.calamus.net/us/index.html

Or try out this site:

>Well my STE mobo is about 460 wide.

The Atari STE mobo is 440mm wide, I just measured it.
Ther Atari MEGA STE mobo is 460mm, ditto.

>I don't know how it fitted in yours.

Made to measure. Just fits in a flight case.
I'm gonna do a 4U kit version to give more space but the 2U version is still
available, also as a kit.

Would it go in obliquely? It would offend the senses perhaps to have
a slanty board. Take up more space as well.

Hi,

I have an Atari ST with the AERCO EASIE-ST Ram upgrade.

It stopped working and I can't find the manual for it..

Does anyone own this upgrade and can send me a photocopy or scanned copy of the manual?

OR, put me in touch with AERCO?

Hi,

Is there some shareware or commercial driver to allow a ZIP 100 to work on an Atari ST?

This may be the least expensive solution for me to get a working mass storage solution for my ST.

I have never been able to win an Auction on eBay for a HDD or ICD Controller. People just bid them up a little too high.

Thanks!

I beleieve you, I just measured the outside case where the board sits.
There is a littkle ridge but I forgot to deduct the plastic width.

The rack case I bought from Maplin was only 430mm internal, but I'm sure
there are wider ones. I don't care now as I have it in a tower.

I couldn't even get it to sit in there! My rack case had turned over bits at the top where the screws hold the top lid on. I drew up professional plans (spent ages on them!) but the quote was 278ukp! Ouch!

Would have looked lovely though but a one off is just too expensive.

You need additional hardware for that. Woller Systems sells a ROM port
adapter for this purpose.

> This may be the least expensive solution for me to get a working mass
> storage solution for my ST.

If I remember the price correctly this is not cheaper than using an SCSI
adapter for the ACSI port. And it is definitely much slower as far as
transfer rates are concerned.

Yes, this is possible with a real SCSI bus (i. e. also with the SCSI bus
of the Falcon and TT).

Yes, they would be able to do a synchronous transfer if both devices
support this.

> If the decoder would work without a (separate) computer on
> the bus, would the decoder be acting as an initiator? What
> other kinds of devices act as initiators?

Any SCSI device can act as an initiator, but in practice it's usually
only the computer that is the initiator.

>idea is to buy an inverter to step 110v up to 240v

As it's ac, he doesn't need an inverter, just an (auto)transformer
110 to 240 V. The different frequency (60/50 Hz) shouldn't matter.
Look in Radio Shack or similar stores. 50 VA should be enough. Or
get a replacement 110V power supply from Best Electronics (likely
to cost more).

>Yes, I would like to know how to silence it also.

If you just want to stop it temporarily to check whether it is the culprit, just shove a pencil through the cooling grille of the case before you switch on to stop the blades turning (you can even do it ater with most small fans!).

If you mean permanently, you could try running some fine (used to be sewing machine) oil on the bearings. An oil film may take up the slack - at least for a while. But replacement fans are available very cheaply at computer fairs etc. Most seem to run off 12V dc and differ only in size and perhaps mountingh, so take your old fan with you. It probably unplugs from the power supply - if not, cut the wires and use a small chocolate block connector for reconnection (or just solder and insulate with tape).

Regards, /Peter/

5455. Re: STe vs. Mega STe?

Newsgroup: comp.sys.atari.st
Date: 2001-04-30 00:04:13 UTC
From: phantomm@bellsouth.net
Message-ID: <1_1H6.4$6o5.1161@news2.atl>
Source record: 47089

I'm enjoying reading this thread.

I have a nice Mega STE TOS 2.06 with the internal hard drive and 1.44 drive.

I was lucky in finding a Vortex ATOnce 386SX board with the 512K of Fast Ram
and have it installed in the MSTE.

Right now the MSTE is in storage, but I will soon be setting it up.

I've a few questions...

This may seem to be a silly question, but I've read some conflicting info.

With the internal stock 1.44 disk drive, What should the drive step rate
be set to on a MSTE, 3ms or 6ms?

And on a Falcon with internal 1.44 drive should the step rate be 3ms or 6ms?

When connecting an external 3 1/2 DD drive to the MSTE, will the MSTE know
that the drive is only a DD drive, since the internal is a 1.44 when I go to
format a disk from the TOS 2.06 DeskTop?

I also have an IB Drive which is a 5.25 disk drive that uses Floppies like
on the Atari 8-bit. I plan on connecting it to the MSTE, has anyone tried
one of these drives with a MEGA STE?

One of the reason I want to use it is for the VORTEX ATONCE 386SX board.

Would also like to try transfering files from Atari 8-bit Floppies using the
IB Drive if possible.

Right now, are there any Ram upgrades for the MSTE to take it up to 8Megs or
more?

I bought some older Mac modem cables that are Hayes Compatible. These will
connect to the MSTE or Falcon's LAN port. Should these cables be alright to use
the LAN port on either machine as a MODEM port?

I also bought some older MAC mini DIN male cables that connect to the LAN ports
of the MSTE or FALCON. Both end connections are the same (male Din).
Can these be used to connect a MSTE and FALCON together like a network?

Or do the cables need to be modified to do this?

I'd like to have both machines connected together either by LAN or MIDI so that
I can transfer files between the computers and still be able to use the Falcon
on the NET at the same time, using STING or STIK2 with Geneva/NeoDesk. I'd
also like to be able to share a SCSI hard drive, SCSI CDROM and SCSI CDR drive
using an ICD LINK II on the MegaSTE.

There should be a few different ways to do the above, I'd enjoy to hear anyone's ideas on how to do this and get the best speed without any data loss.

ALot has been said about the MegaSTE, I think it is an Atari Sleeper Computer. There's lots of performance under it's hood and there's alot of 3rd party hardware one can bolt on if you do alittle searching. VideoMaster, VIDI ST, Replay 16, Spectre GCR and other good Carts.

I'd like to see more DIY projects and commercial hardware to enhance it.

Try an Epson driver, the Star LC-10 was about 95% compatible from memory,
something like an lx-800 I think should be OK. Not many paople bothered with
drivers for star as they were SUPPOSED to be Epson compat.

I don't know anything about Star printers. Does the LC-10 emulate any
of the supported printers?

> As an alternative, can I "print" to Postscript or PDF-files instead, and

If you have the correct module, you can "export" your file as a
postscript file. But it will have to be printed on a printer that
understands postscript commands. I've only had to do this once, so I
don't know how reliable it currently is. My project was rather simple.

The MegaSTE is not different from the ST/STE as far as ACSI/SCSI is concerned. It has the same ACSI bus as the ST/STE, i.e. no real SCSI. No Link adapter can change this. You can never have real SCSI with the ACSI bus, only something that looks similar in some respects.

Hi Bob.

> I'm trying to find the best way to print in colour to my 850C from
> calamus.

As I did not find you in our Calamus user database yet, I do not know
which version of Calamus you are working with.

> Even with the Epson drivers and the rasters I've used so
> far, the results on a test CDK including the RGBFUJI.JPG and the
> COL_KEY.CDK have been very crude. The raster rosettes being
> unacceptably large, larger than with DA'S LAYOUTTC and much much
> larger than with the PC version of Calamus.

Please try and understand that there are different ways to get a fine
print from an inkjet printer:
a) Find the finest irrational raster dot (probably around 36 lpcm)
and optimize the control lines for the inkjet output.
b) Switch off the rasterization engine in the Calamus raster generator.
Then you get an ordered dithering instead. Keep an eye on your
control lines, nevertheless.
c) Use one of the FM rasterization methods offered from Calamus:
1. The StarScreening module (lite version in SL2000 package)
2. The FM filter from the as-Filter module.
d) Use the FM rasterization of a proprietaire Printer Driver.

I am not sure if NVDI offers FM rasterization for Epson printers.
In fact, you need very, very much RAM for printing with NVDI!

On our HADES 060, we use to print with the shipped Epson Universal
Printer Driver and Ordered Dithering, if no FM raster is required.
Again: You will have to tune your control lines in the LIN module!
Inkjet printers use very crazy courves!

If you have access to a PC, I recommend the WinPack version of Calamus
SL. Then you can use all existing Windows printer drivers directly from
Calamus (via the tiny Calamus Printer Driver "WinPrint.CDT") and get
highest, photo-realistic results on your Epson.

PS: I hope my English is not as crude as your prints where ... ;-))

Hi all,

The text compiler for Luna is available.

This software is a companion program for Luna. It is able to manage
projects including several text files (programming, webmastering...).
Registration is now possible via Europe Shareware and the price is
17.00 Euros.

More infos:
http://www.europe-shareware.org/atari/logiciels/ltc.html

Bye,
P. Ricard (ES)

> them over to my Yamaha TX-16W sampler.

(OT) ahh... those 16W... Brave man you are, Hallvard. Those
samplers bring back mixed feelings. Pristine sound quality,
but horrendous firmware that was not fun to operate.

> So Atari have actually been misguiding people with the "LAN"
> labelling of that port!

What old Macs with an AppleTalk LAN port really have is an RS-422
port and software support to use the AppleTalk protocol. Atari
was nearly correct in that their port has the right specs, but
TOS never had AppleTalk (or any other networking stack) support.

Hello!

PH> I have a nice Mega STE TOS 2.06 with the internal hard
> drive and 1.44 drive.

Lucky chap, I wouldn't mind one of those.

PH> I bought some older Mac modem cables that are Hayes
> Compatible. These will connect to the MSTE or Falcon's
> LAN port. Should these cables be alright to use the
> LAN port on either machine as a MODEM port?

That may depend on whether they support hardware
handshaking (apparently some very old Mac modem cables do
not). If you have access to a continuity tester (or a
multimeter) you could check the cable's wiring. It may be
something like this...

MegaSTE Modem
RS-422 RS-232
DTE DCE Comments
~~~~~~~ ~~~~~~~ ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
TX- 3 --------> 2 TXD Transmitted data from the MSTE
RX- 5 <-------- 3 RXD Received data to the MSTE (-)

RX+ 8 --,
SG 4 --+------ 7 SG Signal ground

HSKi 2 <-------- 5 CTS MSTE clear to send from modem
HSKo 1 ------+-> 4 RTS MSTE request to send to modem
`-> 20 DTR (data terminal ready*)

GPi 7 <-------- 8 DCD Modem carrier detect to MSTE

* Odd choice that, you may need to configure the modem
not to hang up if DTR is dropped.

...in which case it should support hardware handshaking,
which is required for modern, fast modems. If you aren't in
a position to check the wiring, you may just want to give it
a try (any smoke that comes out is not my responsibility ;-)

PH> I also bought some older MAC mini DIN male cables that
> connect to the LAN ports of the MSTE or FALCON. Both
> end connections are the same (male Din). Can these be
> used to connect a MSTE and FALCON together like a
~~~~~~~

> network?

If they're wired as a DTE-DTE (crossover, null-modem) cable
then yes, that should be possible. Happily, I understand
this type of cable is quite
'LAN' 'LAN' common as they were used as
RS-422 RS-422 printer cables on Macs for many
DTE DTE years.
~~~~~~ ~~~~~~
TX- 3 ----\/---- 3 TX- This isn't based on a diagram, it
RX- 5 <---/\---> 5 RX- it just seems like the natural
way to make this kind of cable.
TX+ 6 ----\/---- 6 TX+
RX+ 8 <---/\---> 8 RX- I just checked one I have laying
around. It's wired this way, but
HSKo 1 ----\/---- 1 HSKo both ends' pin 7 are wired
HSKi 2 <---/\---> 2 HSKi together. Pin 7 is an input so
that doesn't make a lot of sense
SG 4 ---------- 4 SG to me.

6 7 8
The pins on the 8-pin mini DIN connector are
arranged like this. 3 4 5

The cable I tested is marked 590-0552-A. 1 2

Hello Hallvard!

HT> I already have sample capabilities with the Yamaha
> sampler of course, but also with my AV-Macintosh (up
> to 48KHz at 16-bits, stereo).

I've just been offered a PowerMac 6100AV. Not a bad little machine, but I seem to remember Apple took out the DSP that was in the 68k AV models. I wonder if Atari would have done the same on a RISC Falcon, I guess we'll never know! <sigh>

HT> I think most computers with internal SCSI devices as
> well as an external connector has two separate SCSI
> busses...

Only if you're lucky. Many use a single bus, which is fair enough. If the host adaptor isn't at one physical end of the SCSI bus it shouldn't be terminated, but an internal drive at the end of a ribbon cable should be. I seem to remember that some Macs (Quadra 900?) had separate internal and external SCSI busses, perhaps the internal one ran faster. With two busses, each would be terminated at the mainboard. There would also be terminators at the end of the internal ribbon cable and the external chain. Come to think of it, this is likely to be largely transparent to the user, but it would be worth knowing if they were separate busses because you could have a higher total number of SCSI devices.

Regards,
- Andy.

I think you'd mentioned before that Link style adaptors
don't provide a genuine SCSI bus. From the sound of things
it's not just the connector that is incomplete (as per
Apple, Iomega et. al.), but the bus itself. Is there a text
file or web site somewhere that summarises the differences
(inadequacies? ;-) ?

> The cable I tested is marked 590-0552-A. 1 2

I've just spotted a diagram that shows the pins numbered
differently in that the gap appears to be between pins 3 and
4. Since 6 & 8, 5 & 3 and 1 & 2 are all crossed over, this
shouldn't make a difference to the cable. Perhaps someone in
the group knows the real answer though. Is it as follows?

(plug pin (socket
view) view)

6 7 8 8 7 6

3 4 5 5 4 3

1 2 1 2

Twist 3.02 (which I guess was the last English
version) has all the text strings embedded in the
binary.

I therefore doubt that any later versions would
have seperate resource files I'm afraid :-(

Get book on PC hardware intefacing as they use the parralel port and I would guess the hardware would work on the ST, unless it needs the ECP (I think that is right). The ST does lack pins but I think only data and strobe is needed. My friend used Robert Penfolds book (only 3ukp) and made a basic program along with hardware to control a train track.

I've toyed with the idea to control lights, hifi, alarm clock at set times but I haven't the space and if I were to use my Falcon (in my bedroom) it would be /way/ to noisy to sleep at nights! It's loaded with fans.

Since 1992, there are no drivers for 9pin printers supplied with Calamus
anymore. Invers said that the output from these printers doesn't really
conform to the DTP standard...
But you might find some drivers for this type of printer at the Calamus
website http://www.calamus.net

If not, I've just mailed you a driver for the Star Gemini 10X and Epson
FX, these drivers will work with the LC-10. But since the best and very
slow output is only 240*216 dpi, don't expect a great looking print....

>As an alternative, can I "print" to Postscript or PDF-files instead, and
>then print them out using my Windows-based computer? (This would be a
>preferred solution, in fact, since I could occasionally my friends
>ink-based printers instead of my old, noisy but reliable dot-matrix
>printer.)
Yes and no... there's a postscript module available but it's not part of
the Calamus package, you have to buy it seperately, it's not really cheap
and for the same sum you can buy an inkjet printer....
Futhermore, postscript files from Calamus tend to be rather big, they'll
most certainly wont fit on a disk. So unless you have an alternative to
"transport" these files to a PC, you might be "stuck" again...

>I know very little about Atari-computers, so please keep your replies on
>an understandable, not-too technical level. :-)
I did the best I could :-)

I'm running an MKII Falcon from Germany here in Canada using a step up transformer just fine. It does use the North American frequency rather than the European but there have been no problems. The transformer was from Radio Shack and bloody expensive too...

If you knew what sort of printer the Star LC-10 is (9-pin, laser
etc) then you could try some of the many other printers that come in
the Calamus package. These (demos) are available on the website.
Won't be any good for other programmes, of course, and Calamus is
unpleasant in that they certainly tie fonts, and perhaps other bits
to a particular serial number. Not certain about printer drivers.

I found the Calamus 99 demo impossible to use but the Calamus Lite
seems to work.

> together to share files?

That depends on what you mean by "share files"... The easiest and most obvious way of doing this is to set up a simple PPP or SLIP connection between the ST and Mac, and set up a ftp- or web-server on the Mac. Then you could use something like aFtp on the ST to transfer files. Or - if you prefer your Mac - set up a ftp-server on the ST and transfer the files with the Mac.

In theory it's also possible to install MiNT, MiNT-Net and NetaTalk on the ST, but with only 4Mb I think this would be hard. And you would have to reboot into MiNT every time you want to share files.

> So what was the LAN port for actually? Connecting two Mega STe machines
> together with some sort of networking software?

No, Atari did develop some AppleTalk stuff, but never finished/released it. Some of this (unusable) stuff is now in the hands of collectors.

In general, Calamus Printer Drivers are not serialized. Only additional
printer drivers, which have to be purchased, are serialized, of course.

I built an adaptor to terminate my LAN port as a "standard" 9 pin serial
and the wiring I used was like this.
Female plug looking from wiring side (remeber it's differnet!) is:
I always view from the wiring side of a plug. This was listed in the
Falcon manual and appears just like my plug (just checked)

8 7 6

5 4 3

2 1

And so the socket on the Falcon/Mega STe/TT would appear as your very
first drawing. My adaptor works fine and that wiring you gave seems
correct. I also remeber when I purchased the female plug that it had the
numbers written on it too which matched the Falcons manual.
http://www.airborn.com.au had a very good article on it.

Bye!

>Huh? I can't remember having mentioned any serial port sampler.

But you did: you mentioned your sampler which uses a RS-422 interface, and
in another instance you mentioned a project of yours, also using a serial
port, which I understood to be basically a sampler, too. But maybe I
misunderstood and connected two different things.

>Anyway, using the cartridge port could mean problems....

Yes, I see that occupying the cartdidge port would be a problem for you.

I have never before given much thought to such a peripheral, but making it
seems to be quite feasible. It would be about as simple to install a
sampler (and playback) unit directly on the processor bus (maybe on the
Megabus port on a MegaST). It appears that a ST-family computer should just
be able (barely, if it were not doing anything else at the time) to sample
and record stereo signals at a decent frequency. High quality unit
would probably be expensive, but maybe a 12-bit A/D convertor might be
a satisfying compromise. But, of coure, this is just hypothetical,
as you say you already have a sample/playback unit.

>> standard serial port (I think it complies with RS-422, not RS-232).
>
>So Atari have actually been misguiding people with the "LAN" labelling
>of that port!

Well, it can be used to make a LAN (and I think that physically it is the
same interface as for Appletalk, but no Appletalk software for Atari exists).

No, it is not. My unit is positioned so that I can not see the product name,
but it has a a custom PLCC chip, a 74280 parity generator, a 74ALS648 bus
transciever and couple of other chips which I can't access.

>Just like with my Macintosh, where I have an internal SCSI CD-ROM and
>harddisk, but also an external connector.

Doesn't your Mac have some sort of cover for the external SCSI connector
for instances when it is not used? If it has, it is probably a terminator.

I have seen a DEC AlphaServer with a terminator on the external SCSI port
and also a HP scanner with a terminator on its daisychain-SCSI-port,
so there is nothing unprofessional in them. Remove the terminator and
plug-in a device. Remove the device and plug-in the terminator. It is a
simpler solution than an active termination, though one might be made,
of course. But I don't think you could just leave the active terminator
connected at all times in parallel together with an external device anyway.
From some docs I have, active terminator is preferred for long SCSI cables
and, basically it connects the lines to a regulated voltage source
instead to a resistive voltage divider:

This is a passive terminator:

```
TERMPWR ----+------/\/\/\/------+------/\/\/\/----- GND
| |
| +------------------ SCSI signal
|
+------/\/\/\/------+------/\/\/\/----- GND
| |
etc. +------------------ SCSI signal
```

An active terminator looks more like this (supply filter caps omitted):

```
+-----------+
TERMPWR -----| in out |------+------/\/\/\/-------SCSI signal
| gnd | |
+-----------+ |
| +------/\/\/\/-------SCSI signal
| |
GND ---------------+ |
+------/\/\/\/-------SCSI signal
|
etc.
```

>I didn't get a keyboard with my Mega ST, so it'll have to be the
>(hypothetical) Mega STe's keyboard.

If you can choose, choose MegaST (NOT MegaSTe) keyboard. In my opinion,
it is perfect. It has reliable keys with very nice feel, and mechanically is
very stiff and stable- it has about 1.7kg. (The good one is that with
slanted function keys, the bad one is that with small, square function keys).

>> How important is it to actually mount the thing in a 19" rack case?
>
>It's very important.
>I have lots of rack units already as I'm into making music

I see. So be it.

>devices like turning on a light switch, Camera/VCR, or security system?

A complication involved in using the cartdidge port for anything
lies in the fact that it was designed to be a read-ony port. There is
no read/write signal. Reading from the port is quite simple- just read
(e.g. by PEEKing) from an address in the port address range. Writing
to the port (and therefore, sending signals to outside devices) is
a bit complicated. The port has two "chip select" lines which divide
the port's address range into two equal sub-ranges. Reading from
the port can be confined to one sub-range, and writing to the port
can be done by reading from another sub-range. In this way the
address the reading is attempted from become the data to be sent out.

There is also a mechanical incovenience with the port: the pitch of
the stripes on this edge connector is not standard, but a bit narrower.
And a potential hazard lies in the fact that the port is not buffered in
any way. It goes directly to the processor bus and some fault in the
external equipment connected to it may have ugly consequences.

> for actually?

Meant to eventually support AppleTalk, because back then Macs
were quite popular and having some immediate way to interract
with them was in Atari's plans... except they never got arround
implementing AppleTalk. However, connecting to a Mac serial port
using a printer cable as a null-modem and either some terminal
software of TCP/IP stack allows sharing easily.

> together with some sort of networking software? (As you say,
> TOS didn't have that support, but what about other software?)

Afaik Linux and NetBSD have some AppleTalk implemenetation,
which means that Debian 68k and NetBSD/Atari should work if you
really need AppleTalk. TCP/IP is much better, though.

You need the Bridge module. I haven't kept up with Calamus development, but I sure would like to own the current version. SL98 is the last version I purchased, only money has kept me from buying a newer version.

As someone posted here, it's a tough program to learn. I started with version 1.06, and it took me two weeks to get the printer to print something. <G> But if you want printing power that blows word processors away, this is a great program for that.

It all depends on what you want to do. If you want to do term papers, letters, mass mailing using mail merge, I'd recommend Papyrus. (I've got version 5 of that program.) But if you want to do professional output, such as small magazines, multi-page newsletters, Calamus and DA's Layout is the only way to go these days on this platform, it seems to me. And I don't think Layout is being developed any more, although I have used it for certain projects where it was better suited than Calamus.

At least Calamus is still being developed, and it is available for Windows and Macs.

If it is the one I am thinking of, the whole upgrade depends on one
pin. You see, the 500K upgrade has a ribbon attached to it and on the
end of that ribbon is a socket-type device that fits on top of a chip.
On that device is one pin that if it becomes loose or moves, screws up
the who upgrade. I would take the ST apart and find that socket-device
and maybe press down on it to see if that helps.

Hello all,

What is everyone using for a spreadsheet program nowadays. I have been using LDW Power with my Hades and printing it out on an Epson Photo 700 printer. It all worked fine until today. Now when I print, for some reason it comes out double-spaced. Can't figure out the problem. It always came out in single-spaced. I know it is the printer driver for LDW, but it worked fine before. I would imagine I should pick up a copy of Texel.

I have a MKX Falcon that Im going to sell. I thought I would put it up here before Ebay. Here are the specs:

14 megs RAM Wizztronics upgrade
6 Gig 2.5" hard drive
Atari TT Keyboard(UK)
Floppy drive
SPDIF SoundPool
Cubase Audio Clock
Atari monitor adapter
VGA monitor adapter
Trackball

And a ton of software including Cubase, cubase audio, and a ton of other music related software.

$1200.00 or best offer or???

Don

HUUUGE snip,

The floppy question is one that has puzzled me for a while. I have 2 MegaSTEs, both have 1.44 drives internally. If I connect an external drive (all mine use PC 1.44 mechs), it works flawlessly as a 2meg drive? There is no HD detect line on the external drive yet it works. The dip switch 7, sets the drive type (1.44 or 720), If you connect a DD drive to it externally, It will try to use it as a hd drive. Well not entirely true, the dipswitch ONLY sets the format HD option on the desktop. So, that means if you have a HD drive it will work regardless of weather the dip switch is set or not....

Source record: 47035

About mid/late January there was a call (in this group? or was it in c.s.a.s.t?) for some stock control or invoicing software for the ST.

I responded that I was still working on some I'd started about two years ago.

Since then, I've added quite a bit more to the program (it's grown from 25000 to about 40000 lines of C, and the current complete rewrite started in November has taken about 500-odd hours) Development has stalled somewhat (I tend to hit a "wall" when development hits 500 hours work, but development will usually continue after that, albeit at a slower rate)

Unfortunately, the PoliticallyCorrect I was using to connect to the Usenet decided to foul up in late February, and I've lost the name and details of the thread in which the program was discussed.

The program needs 2 megs of RAM for itself, so a 2.5 meg system would be an absolute minimum. It works fairly well, although the output isn't quite as "pretty" as I'd like it.

FamilyNet Newsgate

I'm the first one to reply to this? No love for the Atari 8-bit world I tell you... no love! (Doing my off hand Rodney Dangerfield impersonation) :)

Anyway, it has been said that in the case of the virtual drives, 800XLDJ is actually more user friendly than the PC counterpart. Of course 800XLDJ only does the drives while the ape utilites do a lot more. But I dygress....

Connect the SIO2ST(PC) cable ... SIO end to the Atari 8-bit (130 XE in your case) and the serial end to the serial port on the ST. Yes I have used a 1040STf before with this... however, I can tell you that 2 meg of memory will not even be enough. You will need more like 4 meg. I know this because I tried a 1 meg and 2 meg system and no dice.
MagicMac and other such emulators do not do well with it either since it uses the DSP processes.

But I have used both 1040STf and 1040STE both with 4 meg.. works like a champ.

Once you get the 800XLDJ program up, load the disk image with DOS 2 for starters or whatever they included, and then drag the disk 1 icon on the loaded image. Then fire up the 130 XE and whammo! Atari disk drive moving at it's capible 19200K speed (which you never saw with real drives due to the mechanical nature of the 1050 drive itself.) :)

Feel free to ask any more questions, and you will find other 800XLDJ users at the Thursday night chat session at:

http://stargate.cs.swau.edu/atari

Thursday night, 8 pm CST

And a time for Europe folk (afternoon/evening) which happens at Sunday at 10 am CST.

Talk soon,

Doctor Clu

AFAIK they are only double sided. The Falcon is 4 layers I think, only
guessing from the time it was made compared to the PC's around at that
time. I think it is though as one via went nowhere so I guess it was
going into the board.

>Calamus.
A few months ago (say, 6 months ago), DA's Layout was still deve-
loped, for both Atari and Mac. I don't remember the adress straight
now, but for those interested, I'll find it within a couple of days.
I hesitated a moment, but as I already own SL, spending over FF6000
in a soft that can't do anything SL does too would have been
irrealistic.

>printer drivers that is included in NVDI.
Yes, of course, since almost all HP LJ are PCL2 compatible. Thus,
You can use a LJ5 with a LJII driver - but don't expect high quality,
since LJII are limited to 300x300.
It can be more difficult in the case of BJs, whose heads may be
driven differently from a model to another immediatly upper.
For instance, the Canon BJ10e was stated as compatible with BJ130e...
but, in fact, it wasn't really true : they were only compatible in
text mode, not in graphics mode.

FamilyNet Newsgate

Hello Hallvard!

HT> So the bottom line is that you can NOT connect say a
> Mega STe and a Mac together to share files?

I'm sure it's possible, but depending on your definition of 'share', probably not without some work. Using very simple software it would be possible to transfer files between a (suitably equipped) Mac and a MegaSTE. I'm guessing you're thinking more along the lines of being able to share files and folders though. This would most likely be more difficult to set up, but it should not be impossible.

It would probably help a lot if the Mac happened to be running MacOS X, or some other Unix based system. A MegaSTE can't run Unix, but MiNT probably supports SLIP (the Serial Line Internet Protocol) and may support NFS (the Network File System). These aren't the only protocol options, but they're trees that I would be barking up.

HT> So what was the LAN port for actually? Connecting two
> Mega STe machines together with some sort of
> networking software? (As you say, TOS didn't have that
> support, but what about other software?)

Atari may have originally envisioned something like an Apple LocalTalk LAN, perhaps even with AppleTalk protocol support and the ability to share files between Apple and Atari machines.

The LAN port's hardware appears very similar to that used by Apple to implement a useful LAN with more than two machines. If the software support existed it might even be possible to build this kind of LAN from Atari machines. As things are, the LAN port makes a nice serial port, and is one of the things that would make me more inclined to buy a MegaSTE than an STE.

Regards,
- Andy.

Hello Djordje!

DV> Doesn't your Mac have some sort of cover for the external SCSI
> connector for instances when it is not used? If it has, it is
> probably a terminator.

I have a vague recollection that some SCSI host adaptor chips would detect the presence of external devices. If there were none, the host adaptor would terminate the bus. If external devices were present, the termination would be disabled and the end of the external bus would be terminated. Perhaps SCSI-equipped Macs used this kind of technique, most of the ones I've seen that didn't have external SCSI chains, didn't have a terminator plugged in.

DV> I have seen a DEC AlphaServer with a terminator on the external
> SCSI port and also a HP scanner with a terminator on its
> daisychain-SCSI-port, so there is nothing unprofessional in
> them.

Absolutely not! Use them where they're appropriate!

DV> Remove the terminator and plug-in a device. Remove the device
> and plug-in the terminator. It is a simpler solution than an
> active termination, though one might be made, of course.

It is quite possible for an external terminator like you describe to be an active terminator.

DV> But I don't think you could just leave the active terminator
> connected at all times in parallel together with an external
> device anyway.

You should have exactly two terminators on a SCSI bus, one at each physical end. If the host adaptor of a computer is at one end of the bus, it should terminate that end of the bus. If an internal device is at one end of the SCSI bus, that device should be terminated. A SCSI device should not be terminated unless it's at the physical end of the bus.

Regards,
- Andy.

>Shack and bloody expensive too...

One possible low-cost source is to look for an old mains
(power supply) transformer for radios etc that have both 110V and
240 V taps on the input. Use this in auto mode to step up 110 to
240V, leaving the secondary side disconnected. (Not sure how
common such transformers are your side of the pond - in Europe
they were *very* common.)

Source record: 46977

Hi,

It still has my attention: I will follow the development. I think it was my question that raised the thread about a proper invoicing software. The existing ones are or German or more or less coming from a database. What i would like to see is a 'stand-alone' invoice program with a nice graphic output. (Most of my clients are working in the 'cultural sector' and are impressed by beautiful designed outputs. So, if i can use this 'rethoric' I'll be glad to...

Keep up!

Raoul Teulings

I have a few Atari items that I would like to find new homes for before I throw it all away. The prices are low and all items look and work fine. So look over the list and email me if you want any of the items. Individual prices below and take it all for just $40 plus postage. Thats $10 cheaper than the listed prices below. I may have a few more items lying around and will throw those in if you buy the $40 "ALL" package.

#1
Atari SF354 External Floppy Disk drive, includes drive, data cable, power unit, and user manual. $10 plus postage.

#2
Practical Peripherals Monitor Switch Box, lets you easily switch between the atari monochrome and color monitor at the flick of a switch, $5 plus postage.

#3
20 Foot Atari Joystick Extender Cable, cool! $5 plus postage

#4
Atari Computing Issue #10 Magazine and included floppy disk, $5 plus postage.

#5
Wico Command Heavy Duty Joystick for Atari, multiple fire buttons, very nice, $5 plus postage.

#6
Atari brand Joysticks, 2 of them available, $2.50 each plus postage.

#7
Pagestream 2.2b DTP Software for Atari, includes original box (nice box), disks, manuals, and even some extra font disks, $10 plus postage.

#8
Michtron Floppy Disk Holder, nice Cordura nylon tri-fold binder style holder and holds your important disks. Got from an atari show years ago. nice. $5 plus postage.

Hi,

800XLDJ was made to emulate a floppy disk, so all of the files are written/read using emulated disks. Getting the ST to have access to the files is another matter.

This is the reason I wired up my cable so it can be used as a null modem cable (9600 baud) to read/ write any file anywhere on the ST drives(using a remote access Flash script on the ST and Bobterm on the A8). My two computers are about 100 feet apart, and it works great. I have more details at my site:
"http://people.delphi.com/rldetlefsen/atari/info/infomain.htm#apps".

Oh, the "doc" are only a bug report, and they are in german.

One day, a better program will be written.

5535. Atari Productivity Software Sale / TT030 to come

Newsgroup: comp.sys.atari.st
Date: 2001-05-02 06:20:17 UTC
From: Frank Zimmerman <zimmerman@uniserve.com>
Message-ID: <tevd37lcs9tke6@corp.supernews.com>
Source record: 46972

Hi,

I currently have the following items for sale on eBay:

Avant Vector
CardFile4
Data Diet 2.0
Diamond Back 3.60
Disk Doctor / Good Backup Utility
Mouse Master (Joystick/Mouse Switchbox)
NeoDesk 4 Replacement Desktop
Outside - Virtual Memory Manager
Hard Disk Sentry
STyle 2.1 Graphics Editor
Universal Item Selector III
Ultimate Virus Killer 2000

You can view these at:
http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=frank-zimme
rman&include=0&since=-1&sort=2&rows=25

In a short while I will be posting the following as well:

NVDI 5
The full ExtenDOS package (ExtenDOS Gold, CDWriter plus 2, CDbackup)
Dr. Bob's MVG (monochrome graphics editor) with Modules
Papyrus 8 (maybe...if I can separate it from the PC version).
Fonty (Calamus font editor)
PixArt4
Harlekin 3
HDDriver 7
FontKit Plus 4
EditPlus
MaxiFile 3
CodeKeys
ECopy
FastCopy Pro
ImageCopy 4
Kobold
FaceValue/GFA Basic 3.6/Interface
Diamond Edge 2
Genus (Calamus Font Editor)
ImageCat
Outline Art 3
Silhouette 1.40
STeno

Straight Fax 2.1
Spiritware Bible Program (KJV, pro version)
Prospero Pascal
SharpScore 3.2
Calamus95 (for Windows)

There are a few other items such as some CD-ROMS of graphics and publishing materials and some shareware programs that I've registered which will also be posted.

On the hardware side, I will also be posting:

2 - TT030 computers, both of which have 19" monochrome monitors (one Moniterm, one TTM195). These both have TOS 3.06, High Density floppies, replacement mice, and RAM upgrades (20mb and 128mb) but I may sell the RAM separately. One of these was purchased from Oregon Research and has the distinction of being the machine that DiamondBack and Diamond Edge were programmed on! (it's not signed by Bob Luneski though, but I will supply the original bill of sale).

1- Microtek legal size (14") color scanner with SCSI interface and Atari software.

1 - Pen Mouse.

1 - Golden Image Track Ball.

1 - Migraph Hand Scanner and Scanning tray with ScanLite and Merge software.

1 - Very rare and beautiful Mega/TT Atari softshell case for transporting a Mega STE or TT030. It consists of two parts, one for the CPU/keyboard/mouse/cables, and one for the Monitor. I think the monitor case will only fit the ST monochrome or color monitors (you might be able to squeeze in a 14" VGA). I got this from David Becker (anyone remember him?) when I bought his Mega STe many years ago.

The hardware posts might not go up this week, but the rest of the software should.

Email me for any questions or pre-auction offers.

Regards,
Frank.

I was originally intending to sell it, but a rethink on the salability
of it would mean I'm unlikely to get anywhere near a decent income
from it, so I'm still thinking of what form it'll take
(commercial/shareware etc)

ATM, I'd like some testers. There are still quite a few funcs I still
have to implement, and a few co-operating progs within the suite I'd
planned that I'm mulling over.

We agree shipping Calamus on cc payment in 2-3 rates, too. ;-)

> As someone posted here, it's a tough program to learn. I started with
> version 1.06, and it took me two weeks to get the printer to print
> something. <G> But if you want printing power that blows word
> processors away, this is a great program for that.

Come on - this was in 1987, 14 years ago.
If you want access to all current printers, get Calamus SL2000 WinPack
or TOSPack on a Mac. Our universal printer drivers WinPrint and MacPrint
offer access to the existing printer drivers on both platforms. VDIPrint
offers access to all printer drivers offered by NVDI.

> And I don't think Layout is being developed any more, although I
> have used it for certain projects where it was better suited than
> Calamus.

The Atari version of DA's Layout died away as far as I know. There is
still a crude version for Mac.

> At least Calamus is still being developed, and it is available for
> Windows and Macs.

... and still for Atari TT/Falcon/Hades/Milan (256c or TrueColor
required).

Even that isn't easy (at least if you want to print greyscale or colour
images. As Ulf has already alluded, there are many controls to tweak.

AFAICS that kill file is only for emails (as Charles said).

Maybe we should promote ASH's Emailer more strongly then, there's all kinds
of useful filtering and other goodies contained within...

Us CiX users were able to dowbnload the various beta upgrades from the
appropriate support area - AFAIK the last full version sold by the FaST
Club matched the last beta viz 4.2b2 Plus.

Why not try phoning the FaST Club? A phone call's not as easy to ignore as
an email.

Yes, as long as it is set to drive 0, not drive 1.

HT>HD disk drive - (will build a HD/DD interface and use
HT> an AJAX controller instead of the
HT> WD-1772)

Be careful. There are early MSTEs that don't have the necessary AJAX chip to support a HD drive and more important they need a replacement GAL chip which is very hard to find nowadays (perhaps BEST has some of them). So try to find one of the MSTEs that already have HD support included.
And some STEs/MSTEs have a wrong chip that produces noisy DMA-sound. I once had such a machine and it was very annoying. It took some time to find out what causes this sound and then it took some extra money to replace the chip (fortunately they are all socketed).

If you do not plan to upgrade your system (processor upgrade) I would recommend the MSTE, in any other case try to get a STE instead. BTW, I had both machines. ;-)

Tschuess,

Frank

I'm 99% certain they were. The lan port works fine with my 10 foot null modem cable to sometimes hook it up to the ST or PC. Next is ethernet for ST, PC and Falcon (Falcon as the internet server/gateway!)

AFAIK it doesn't have any drivers available, certainly not AHDI and
HDDriver. On the Falcons parallel port I can run my Epson GT9000 on it
with out any extra hardware, just GT Look. It stays on the SCSI though as
I want to use my printer as well.

I think Woller Systems provide a driver with their Romport card, which
enables you to connect your parallel ZIP to the Falcon. As far as I know
even the Falcon's parallel port misses some signals, so that you cannot
connect a parallel ZIP to it.

Hi-res monochrome monitor. Good condition, no screen burn.

Preferably collection from Luton. Just want to clear some space, and not waste a good monitor that's just sitting in the loft - looking for about 10ukp.

Can demo if required.

May also have a couple of boxes of Atari User and Format magazines to offer - no discs (I found a home for those) - free to collector (especically if you buy the monitor). Again just clearing some space.

Cheers

>240 V taps on the input. Use this in auto mode to step up 110 to
>240V, leaving the secondary side disconnected.

Just take care that the transformer is powerful enough. IIRC Falcon power supply is supposed to be able to deliver 4A/5V and 1.5A/12V which means you should find something that can handle about 40- 50 Watts, so that the transformer does not become a bottleneck if additional equipment is connected to the Falcon.

A relatively reliable rule of thumb for estimating transformer rating is that the metal core cross-section (in centimetres squared) is approximately equal to square root of primary power (in Watts). In your case this should mean a transformer with about 2.5x2.5cm or 3x3cm core size. Wire diameter should be such that there should be no more than 0.4A/mm2 in order to minimize heating (no need to use the transformer as a toaster).

>help?
>

There are two possible reasons for the clock stopping, either it has
exceeded it date limit (as it was not designed to go beond 31/12/1999) or
the battery has died, not surprising as its probably at least 10 years old.

As you will know if you read and correctly understood the instructions for
the Y2K patch you have to set the date for 20 years ago so that the patch
adds 20 years to it thus arriving at the correct date.
I don't think its possible to enter too many days for the month, unless its
using the American date format of Month/Day/Year, but my FMCII is
Day/Month/Year, so try setting it to todays date but set the year 1981.

If that does not work then either a logic glitch has locked it up or the
batter is dead. Try removing the battery and checking its voltage, if its
soldered in there are usually three connections, two will be connected to
the same polarity, desolder the remaining connection, if it is in a battery
clip it should just slide out, if it is a slide out battery remember to make
a note of which side was positive.
If the battery is flat, change it, if not reconnect it, as the circuit has
been powered down this may resolve any logic glitches that have latched up
the clock.
There are two small clips on either side of the case, you can use a small
screwdriver to lever each side of the case apart. You should note which way
round the case was when you remove it as I seem to recall that if you put
the case on the wrong way round it will not plug back into the cartridge
port.

>
>Joshua.

I don't think there is one, those PC lot aren't into writing games and suff, just playing them and so nothing as usefull as STOS was written for them. Any BASIC program will have the same general commands, if fact I have ported Text only STOS programs to the PC using both QBASIC and Visual Basic, the only real changes I had to make were with the text location (I think X and Y were interchanged on one of them!) and setting the correct screen mode. As far as I know there is no compiler for QBASIC and so you can only run your programs from within QBASIC, however Microsoft Visual Basic (VB) does come with a compiler.

The problems come with the graphics and sound side of things as there is no way of using Images as backgrounds, although this may not be the case with the latest version of Visual Basic of Windows. Also there is no Sprite Designer facillities and so you will probably have to code all you sprites and background images using thousands of draw commands. Finally, there is also no Music Definer, therefore you will have to use a plain "sound" command specifing IIRC frequency, volume and duration, again the latest version of VB for Windows might allow samples to be used as it can be used to write web applications.

VB has or at least had a decent manual, although I have only uses a early DOS version software written on it can be used under windows, as I said its good for Text only programs. The only design facility the DOS version has is a Form Designer that allows you to create forms containg some predesigned objects such as Text (Lables), Picture Boxes (mainly used for grouping objects together), Menus, Command Buttons, Option Buttons and Text Boxes for user input, again the latest version might have more design facilities.

Goto the Microsoft web site to find out more about VB, I'm sure this it will have several images of what is capable or send me a mail and I could e-mail you either a program or screen shot as examples of the type of thing that can be produced.

>I'm having trouble connecting to the Belgian FTP Site 193.190.204.128

I sort-of got through, but there are no folders or files listed (using
either the address you quote or the Chapelie one). Oddly though, I managed
to download a file from one of Martin's update notices by copying the
complete pathname into an ftp client. So the files are still there it
seems, except that for some reason they are not listed!

use telnet, not hyperterm. telnet to that address and you should then be
able to get on. also make sure that you are online and connected to the
internet before trying to telnet into the bbs. and if you are connected to
the internet, make sure that telnet ports are not being blocked if you are
at a company or school.

No ports blocked that I can see. I get to the Internet from home using a cable modem. I am running a firewall, but AFAIK it doesn't block ports without throwing up a warning.

The way my machine is configured in Windows 98, HyperTerminal is the default telnet client.

I'm going to try it in Linux when I can.

i acutally didn't realize that you could use hyperterm as a telnet client.
i always thought of hyperterm as being like an old terminal program that you
would use the serial cable or modem with.

have u tried shutting your firewall down completely then trying to logon to
the bbs?

Alan,

This may actually be a problem with _my_ firewall. Please send me the IP
address
of your cable modem, and I will make sure that I am not blocking that address.

Oh, and the BBS is up and running 24/7, so hours would not be a problem.

Thanks,
Chris

Hello Bo!

BS> use telnet, not hyperterm...

Some versions of Hyperterm can be used as a telnet client,
and seem to have much better terminal emulation than
Microsoft's telnet client supplied with MS-Windows. Instead
of choosing a modem or serial port, you can choose 'TCP/IP
(WinSock)' and enter an IP address or FQDN instead of a
telephone number. I don't know whether Alan was using it
this way though.

Regards,
- Andy.

Out of interest, what kind of throughput do you see over your serial cable? Will your ethernet be used for file sharing or just to share the Internet connection? Have you decided yet what ethernet adaptor you will be using on the ST and Falcon? What software will be acting as a router on the Falcon?

FamilyNet Newsgate

Hello Steven!

SM> As far as I know there is no compiler for QBASIC and
> so you can only run your programs from within QBASIC,
> however Microsoft Visual Basic (VB) does come with a
> compiler.

I seem to remember that QBASIC was a cut-down, interpreted version of Microsoft QuickBASIC (which was a compiler). I have never used that though, so I don't know what it's like.

SM> The problems come with the graphics and sound side of
> things as there is no way of using Images as
> backgrounds, although this may not be the case with
> the latest version of Visual Basic of Windows.

Even if there were no routine provided that can do that for you, it should be possible to write one. There's a good chance routines exist to read and display PCX or GIF files for example. GIF would probably be more compact, I have a vague recollection that PCX files were very closely related to the PC's frame buffer layout, so should be easy to load. PCX would probably be slightly faster, neither would be great in an interpreted environment. Perhaps QuickBASIC came with low-level routines to speed things up though.

SM> Also there is no Sprite Designer facillities and so
> you will probably have to code all you sprites and
> background images using thousands of draw commands.

Ouch! ;-) I would be more inclined to either use an existing image format and image editor, or a simple proprietary image format and write my own sprite editor. I guess you could write something with a 'retro' vector-graphics feel using draw commands though.

SM> Finally, there is also no Music Definer, therefore you
> will have to use a plain "sound" command specifing
> IIRC frequency, volume and duration...

---------------------------------(From QBASIC)---------------------------------
PLAY commandstring$

* commandstring$ A string expression that contains one or more of
the following PLAY commands:

Octave and tone commands:
Ooctave Sets the current octave (0 - 6).
< or > Moves up or down one octave.
A - G Plays the specified note in the current octave.
Nnote Plays a specified note (0 - 84) in the seven-octave
range (0 is a rest).

Duration and tempo commands:
Llength Sets the length of each note (1 - 64). L1 is whole note,
L2 is a half note, etc.
ML Sets music legato.
MN Sets music normal.
MS Sets music staccato.
Ppause Specifies a pause (1 - 64). P1 is a whole-note pause,
P2 is a half-note pause, etc.
Ttempo Sets the tempo in quarter notes per minute (32 - 255).

Mode commands:
MF Plays music in foreground.
MB Plays music in background.

Suffix commands:
or + Turns preceding note into a sharp.
- Turns preceding note into a flat.
. Plays the preceding note 3/2 as long as specified.

* To execute a PLAY command substring from a PLAY command string,
use the "X" command:

```
PLAY "X"+ VARPTR$(commandstring$)
```

Example:

```
'Play scale in 7 different octaves
scale$ = "CDEFGAB"
PLAY "L16"
FOR i% = 0 TO 6
PLAY "O" + STR$(i%)
PLAY "X" + VARPTR$(scale$)
NEXT i%
```

---------(End QBASIC)---------

...not a module player by any stretch of the imagination
(but then the PC /did/ come with a $0.25 speaker ;-)

SM> ...again the latest version of VB for Windows might
> allow samples to be used as it can be used to write
> web applications.

Visual Basic (they don't call it BASIC, I don't know why)
probably does let you play sampled sound on a machine that
supports it.

I'm suspicious of VB. It ties you to one platform, and depends on libraries that haven't historically been very dependable. You're also at the mercy of Microsoft's every (expensive) whim. There are other BASIC implementations available, including some that are available on more than one platform. I downloaded Yabasic ("Yet another Basic for Unix and Windows"... looks like they don't call it BASIC either) the other day. It supports graphics under Unix + X and MS-Windows. I was looking for a text-based portable BASIC so I haven't done much with it apart from play the supplied Sokoban demo a few times.

I should probably look at Chipmunk BASIC again, I think that is available for Mac, PC-DOS and Unix. There may even be a port for MiNT, I don't know.

Regards,
- Andy.

Actually, for light switches and security systems and VCRs (maybe cameras,
too), it's easier to plug an X-10 interface onto your serial port and use
the extensive possibilities there. See www.smarthome.com

Is this releated to the hard drive problem as well? I have a STE that
does this but I'm not sure if it corrupts hard drives as I never used it
for that. The noise problem is very annoying, especially playing games
like Obsession and Substation. Luckily my other STE (towered) is fine.

There are some temporary problem with the server. The webmaster is doing
his best to solve this asap but alas it seems to be a hard to find
problem. The server is still up and running but people with a anonymous
account will see only a empty dir.
That's why I haven't posted the new uploads in the newsgroup.

OK then. Inaspect the drive for any jumpers and select as ID0 or DS0. If there are none (usually on the back near power connector) then it is a small solder pad on the board it self. This may require removing the case of the floppy drive. Almost every time it is near to pin 10 or 12 of the shugart floppy connector.

When I get around to it I'll see if I can get 2 floppys to work on my Falcon as it is lacking the other DS line. Should be easy enouigh, just an inversion of DS0 with an old TTL, or NPN tranny.

Hey everyone! I have an exciting piece of hardware for sale. It's my old TT graphics card. Here are the specs:

Dover Research AlberTT VME Graphics Card
1024x768 or 800x600 with 16 colors (out of 4096)

This card is a very nice piece of hardware and I was using it quite happily for a time. But I no longer need it. The card comes with a disk with two small driver programs to start the card. The card worked beautifully with normal TOS and MiNT with XaAES, MultiTOS, and Geneva. I've heard it won't work with MagiC 6.

This is a great piece of hardware for anyone doing work on a TT since it really expands your workspace. I was using it with AtariWorks, Calamus SL2000 and the Internet browsers. I never found any incompatibilities. I've used it with three or four different monitiors and I've not yet had a problem.

I'm asking US$50 for the card as that is how much I paid. I would prefer to sell to a US user, but I will ship overseas if necessary. If you're interested, send me an e-mail. I'm located in Cleveland, OH, USA.

Yes, this is what I am seeing. After connecting I get an empty Directory window. I notice on my CT2B Falcon that my IDE hard drive whirls very Fast when trying to read the directory. It's like that there is not enough time to read the directory. I'm using AFTP.

I hope the problem gets solved. This is one of my favorite FTP sites. :)

Try <URL:http://gary-priest.atari.org> or, if atari.org goes down,
<URL:http://www.gapcs.fsnet.co.uk/atari/atari.html>.

As for the demon site, he posted in October last year that he was moving
his site and it should have disappeared sometime early November. Maybe
the upgrade to their servers has finally killed it off.

> ....Why?

I have three things to say:

1. Grow up.

2. What is this sick obsession you have with putting down those who choose to use Atari's? I happen to have a Mac, like you. But unlike you, I actually prefer to use my Falcon for most things. The Mac (ca.2000 350MHz G3 iMac, in case you were thinking I had an old crappy one) is basically my internet machine until we get a better web browser on the Atari.

3. Follow this simple rule and you will be happy (if that's even possible for you): the best computer for you is the one that does what you want, the way you want it done. If that's a Mac for one person, an Atari for another, a PC for another, a Commodore VIC-20 for another, etc... that's great! Leave it as it is and should be!

Mike Freeman
nameerf@flash.net

P.S. - If you were brave enough, you would post your real name and e-mail address, so this can be taken off the newsgroup and into e-mail, where it belongs. Why don't you?

Lyndon, Pascal, and anyone else who's interested,

I THINK that Eastern time is GMT -5:00. I'm relying on memory here, so don't hate me if I'm wrong.

Please feel free to make use of the chatroom when ever you want to. Just because we have scheduled chats at a particular time on a particular day, there's no reason that you can't make use of it whenever you want to.

We really want this to be a resource for the entire Atari community, not just those who happen to live on the east coast of the United States. THAT wouldn't be very nice now, would it? <grin>

I'd be happy to answer any questions you might have about the use of the chatroom (commands and such).

Be well,

Joe

I agree with you about getting rid of the bells and whistles.

The other thing that we're happy about is the fact that it seems pretty darned solid. Not a single crash or snafu since we've been testing it.

The rest of the BBS system MAY become functional in the future, but our main concern was getting a chatroom up and running to take the place of Delphi's chat. Mission accomplished, I'm relieved to say.

See ya in the chatroom,

Joe

No, you can do that with the HDDRIVER software:
http://www.seimet.de/atari_english.html.

Note that there is no need for formatting, this is just a question of
partitioning.

FamilyNet Newsgate

For those that are in the Dallas /Fort Worth area, we will be having an Atari house party on Saturday the 5th. For those slightly out of town, this is a good time to visit Dallas for the First Saturday Sidewalk Sale in the early morning and then come by for the house party JYBOLAC (Just Your Basic Online Atari Computer) is having. If you want further details, write me at:

drclu@swbell.net

Look forward to hearing from you,

Doctor Clu

PS: If you have friends of other 8-bit platforms, they are welcome to attend as well, though the theme will lean more towards Atari.

Very unlikely using modern drives. 99% are set right. The usual rule of
thumb is pin 1 of the shugart cable is closest to the power conector.
However Panacronic drives don't adhere to this convention. Try a TEAC they
are great.

G'day Lyndon, as I remember it was the DMA chip that killed data on hard drives, Atari reckoned they got them all fixed (bollocks), the noise problem is the sound chip as Frank suggested. Just looking at a Mobo now to see...Have a look at LMC1992, also acording to the schematics a 74ls02 was added to Fix sound data hold problems. The problem could be the DMA chip or the Sound chip, or both. Have a look at schematics central? I appear to have dug up a can of worms, the schematics for the MegaSTE give me the irits. Gals every where. I have never heard of a MegaSTE having hard drive problems tho as when they were released it was well after the stuffed STE DMA debacle. Not to say I'm wrong tho;-)

As far as the 1.44 issue goes, a WD1702-02 should be OK. This is the chip used in most ST hacks for 1.44 drives. The Ajax is the sort after chip tho. These were designed to run fast enough to drive a 2.88 meg drive. In practice most 02-02s will run fine at 16Mhz.

Mark

PS Sorry about the slur, just having a drop of red ned.

We have about the same "character" in the French Atari newsgroup. I
sometimes wonder if it's not the same person :-)

Let trouble-makers shout their hate, keep on following your opinions.

Bye,
/Pascal/

Sorry, that's wrong. There are a lot of game programming languages and
construction sets for the PC. They can't be compared with STOS since the PC
ones are generally much more powerful (i.e. supporting modern 3D engines,
image formats etc.)

Greetings,
Matthias

Uwe is correct. I've used HDDriver to swap SyQuest cartridges and SCSI hard-drives back and forth from a PC to an Atari. It works great! But the cart/drive must be one partition only (if I remember correctly).

I've been told 115k so this is as far as I went. Anyway the PC only has the 8xxx UART :)

> Will your ethernet be used for file
> sharing or just to share the Internet connection?

Both and possibbly as printer sharing though not sure whether this can work at all. One could always covert to some other file format (image?) then send as file and print. One thing I was wondering was if I could select Adobe Acrobat (installed on PC) as an application for Jinnee, so that when I double click on a PDF file on the Falcon, it could pass the parameters over to the PC and it would pull the PDF across the network from the Falcon HD and display automatically.

> Have
> you decided yet what ethernet adaptor you will be using
> on the ST and Falcon?

I'm making a cartridge based type that uses a NE2000 ISA /hopefully/ in 16bit mode but lack of address space and flexability is making it tough! I'm trying to keep it down to a minimum of bus cycles to save time and get that kbytes per second up!

>What software will be acting as a
> router on the Falcon?

Sting 1.26 on the ST and Falcon, and from what I've heard/read NAT32 will do the job on the PC.

Hey fuckhead. Far worse than insulting a historical computer, you've insulted me simply for trying too show some gratitude to a guy that was willing to give something to a total stranger. You've insulted someone who has acted with generosity. And for what? So you can take a few jabs at people who actually have some taste in computers? You see the computer world as if it popped into existence 10 years ago just to suit you, and anything other than the generic PC, which is watered down just enough for someone of your diminished mental capacity, is some freakish mutation. You can't possibly imagine anyone wanting or using something older than 6 months, even though to some of us, a computer is more than a $1000 nintendo whose games grow boring within a week. Go to hell. We don't need you here, or anywhere else for that matter. Take your insults, both the Atari insults, and the insults against good manners and kindness, elsewhere.

John

Yep, that's true. A week ago the RMA has take in use a new server
(Alpha) The people in charge (students of the RMA) did make some setup
faults. They are trying now to find out what went wrong but as they are
doing this in their sparetime - students seems to have not very much
sparetime, espescially in Belgium with all that good beer- it can take
some time.
Anyway, in the meanwhile you can still visite the server if you use the
following address:

ftp://heracles.rma.ac.be/atari.

Be aware though that this is just a temporary solution. Once the
chapelie.rma.ac.be is fully operational the heracles will be put out of
order.

I'll make the new uploads to both servers.

HTH,
Martin

Sooner or later they will track dowm the problem. It's weekend
now so the people in charge are not at the RMA but from monday
on they will get some help from Karl Samyn who knows the
inns/outs of the RMA very well. So it just a matter of a few
days before the serevr is up and running again.
In the mean while you can use ftp://heracles.rma.ac.be/atari but
be aware that this is just a temporaly solution. This server
will be closed down as soon as de chapelie is working properly.
For me this means double work. I must make the uploads to two
servers now.

Hello/bonjour,

You probably have noticed that ftp://chapelie.rma.ac.be/atari have
some problems. People with a anonymous account will only see an
empty dir. The webmaster is trying to track down the problem. In
the mean while you can use the following address:
ftp://heracles.rma.ac.be/atari
Be aware this is a temporaly solution. Once the chapelie is
working properly heracles will be shut down.
I'll make my new uploads to both servers.

Pour les Franï¿½ais la mï¿½me chose:-))
Le serveur ftp Belgique connait quelques problï¿½mes ï¿½ caractï¿½re
temporaire.
Dans l'attente d'un solution propre tu peut utilise l'adresse
suivante: ftp://chapelie.rma.ac/atari
Attention, cette adresse est seulement valable jusqu'a le
chapelie est de nouveau operationelle.
Je va faire les tï¿½lï¿½chargement de nouveau logiciels sur le deux
serveur.

HTH,
Martin

>Gals every where. I have never heard of a MegaSTE having hard drive problems
>tho as when they were released it was well after the stuffed STE DMA
>debacle. Not to say I'm wrong tho;-)

From what I heard it was only progs that took advantage of the DMA sound,
not the YM. I'd be supprised if it was a LMC1992 problem as these were
made by National Semiconductor IIRC. I'm not sure about the 74LS02 as I
deleted my set of ST schematics.

>As far as the 1.44 issue goes, a WD1702-02 should be OK. This is the chip
>used in most ST hacks for 1.44 drives. The Ajax is the sort after chip tho.
>These were designed to run fast enough to drive a 2.88 meg drive. In
>practice most 02-02s will run fine at 16Mhz.

Mine didn't :(I could have a go at putting the AJAX I have in the mobo
but can't be bothered! I find it difficult removing chips. I've never
bought a solder sucker as I can't believe it can remove it all, I've
always thought these were for large solder blobs.

Hallvard is correct actually :) For the ST this is true and maybe for the
Falcon (I can't remember!) The connector does need to be turned around.
Pin 1 is usually near the power connector as you say. It can be plugged
in the wrong way around without harm if done so for less than minute or so.

5637. WTD: Atari CD's

Hi

Anyone in the UK have any Atari CD's for sale. I'm particulary looking for the Atari Commendium and any mix type CD's eg Suzy B, especailly one's that are for the Falcon only. I'm not too worried if they're bloated out a bit with demos.

I'd prefer them to be in the UK to safe P&P, but if you have any you feel would suit me please email me details.

Thanks

I certainly recall your name mate. It does seem like too long ago. Never since, have I been apart of such an online community. (urghh!). Still, got the old dear though. Even though she has been the subject of many a cannabalistic project, she still runs sweet, in her old trim .:)

Source record: 46928

The problem isn't with the "modern" drives, it's that the Epson drives Atari put in the STs have the data connector backwards from the "Pin 1 by the Power Connector" that became the standard later on.

Thus the cable in the STs is set up to be plugged in backwards from the way any modern floppy drive needs it. In some cases just flipping it upside down isn't a problem, but in some models the cable may not be long enough.

Also, there IS a problem with the "media change line" between the way Atari handled it with the Epson drives and more modern Teac style floppy drives.

With a newer drive, the Atari may not detect that the disk has been changed if you pop out one and stick in another.

That means it has the old disk's directory cached in memory. If you try to write to the new disk while the old directory is still in memory, you'll trash the new disk.

(I have an SF-314 that does the same thing, just never got around to fixing it.)

You either have to short the pins mentioned in the earlier message, or you can manually force a re-read of the directory by pressing ESC while the directory window is open. Of course, that means you have to get into the habit of doing it religiously if you don't want to end up trashing floppies.

Another problem with "modern" floppy drives is that all of them are now "1/3 height", while the Epson drives Atari used were "1/2 height". This can cause some trouble getting the new drive to fit properly, although it's not insurmountable.

It's been a looooong time since I had my STe open, so I can't say for absolute certain that all this still applies to that model (and the original question referred to an STe).

|version 1.06, and it took me two weeks to get the printer to print
|something. <G> But if you want printing power that blows word
|processors away, this is a great program for that.
|
|It all depends on what you want to do. If you want to do term papers,
|letters, mass mailing using mail merge, I'd recommend Papyrus. (I've
|got version 5 of that program.) But if you want to do professional
|output, such as small magazines, multi-page newsletters, Calamus and
|DA's Layout is the only way to go these days on this platform, it seems
|to me. And I don't think Layout is being developed any more, although I
|have used it for certain projects where it was better suited than
|Calamus.

It is not as intuitive as Papyrus and the output using its own fonts
at small point size was worse than Papyrus. I have tried TrueType
fonts with the Lite version and that combination certainly seems to
be a lot better.

On the other hand the ability to group frames, fix frames etc was
very useful. I also had a steep learning curve with the early demo
version (1.09 perhaps?) as there was no manual.

> Could you please describe this modification ?
>
> I tried to connect standard PC floppy to my F030 but without any luck :(

It depends on the individual drive type. Most of the older ones
have either a jumper or a solder-pad that selects drive 0 or 1,
usually with a marking nearby to identify which is which. The Sony
and Teac drives I have seen have these - I don't know about
others.

There is a full description of how to modify the Sony MPF 520-1
drive (particularly suitable) for HD disks too available from
Hallvart Tangeraas. Email him on hallvart@sn.no for details. I
think the info is also on the web somewhere, but don't have the
URL.

5649. Reviving a forgotten TTO30

Newsgroup: comp.sys.atari.st
Date: 2001-05-04 22:23:09 UTC
From: David Johnson <drj344@rivermhc.org>
Message-ID: <3AF32BCD.5EB82D9E@rivermhc.org>
Source record: 46932

I'm trying to revive a TT030/8 that's been sitting in disarray and in pieces in a closet for some years.

Problem #1. led, speaker, and battery leads removed. Unfortunately, there aren't clear indications on the mobo as to what goes where.

Problem #2 Missing screws. Does anyone know off hand what size case screws are required to secure the mobo?

Problem #3 That damn shielding. I've got a TT030/8 with a 32mhz processor and TOS 3.00. It's got that gray metal shielding in side. Part of the reason the computer sat idle for many years was that immediately after dis-assembly, I couldn't see how to get the shielding back together w/o it leading to shorts n' such. I found out from the guy at ATY computers that could just rip it all out.

But that said, where is a good place for the speaker to go. Hmmm. will probably depend on where the speaker lead ultimately goes to.

Problem #4, Clock battery. Off hand, where is the best source?

BTW, the computer boots up and seems to run apps just fine. It looks like once I get a new SCSI HD in it that it will make a killer addition to my midi rig.

Funny. I don't think I would have gotten the urge to mess with this stuff unless I hadn't started playing around with that STeem emulator on my pc.

Thanks all,

David

>from the Falcon HD and display automatically.

For remote printing, I'd suggest you have a look here:
http://home.nexgo.de/thomas.redelberger/prj/atari/trlpr/index.htm

Running PDFs on your PC from the Atari seems nigh-on utterly hopeless. The
only idea I can come up with would be running a telnet server on your PC, then
specifying the helper app for PDFs on your Atari to a command line sending
"C:\PATH\TO\ACROBAT.EXE NETWORK:\\ATARI\PATH\TO\FILE.PDF" or something to that
effect.
Sounds remotely doable if you're running MiNTnet.

I happen to be in my late 20's, with a degree in Music from a fairly prominent university, with little interest in sports. I have no interest in putting down others' choices in computers or anything else in life (and think those who do, have either a serious maturity problem or low self-image). How about you?

>> 2. What is this sick obsession you have with putting down those who choose

>
> Were in the message did I say this?

This is taken from the other abusive posts I've read from you. Knowing from the past that you are an avid Mac user, any comments intimating (even sarcastically) that Atari's aren't viable computers, borderlining on contempt for their users, is seen by me as fitting in nicely with my second point, which you quoted. Your original post does exactly that.

>> 3. Follow this simple rule and you will be happy (if that's even possible

Here's a great example of the use of English... First, what does "etc." mean to you? Second, don't you mean "except"? At least you said "Yep," meaning that there is an inkling of agreement with my statement on your part. There may be hope for you yet! :)

wrote:

>>
>>>> > Yes, as long as it is set to drive 0, not drive 1.

I just spotted this line, this is true also.

PC style floppy drives are universally set to be drive 1, while the
Atari needs the floppy to be set as drive 0.

Originally the intended scheme was to have each of the floppy drives
in a PC set to its own drive number, drive A: would be 0, drive B:
would be 1. The cable would be straight through all the way from
the motherboard to the end connector.

However IBM found that it was a lot easier to simply supply all the
floppy drives set to the same drive number and put a twist in the
floppy drive cable to reverse the one on the far end, which is always
A:. This way they could send out the drives without having to worry
about whether the person installing the drive had a clue about drive
addressing.

With all the drives set to 1, the twist in the floppy cable reverses
that on A: to make it 0, and everything works.

Except when you plug a PC drive into an Atari.

Because the Atari system does not connect both floppies to the same
cable, there's no "twisting" in the cables, so the computer needs the
drive set to 0.

So, yes... be sure you get a PC floppy drive that CAN be set to 0,
and be sure you get docs showing where the jumper is, and how to
change it.

Windows 95 was convinced it was a 8xxx and so did MSD under dos. It was
quite fast in the end, about 7k a sec, no packets were being dropped
according to hyperterm.

For the normal DIL chips it's probably best to cut through all the pins
(close to the chip, so that you have something to grip), then unsolder each
of the bits and clear the holes with solder wick.

SMD chips, you're on your own!

Hello Lyndon!

LA> I've been told 115k so this is as far as I went.
> Anyway the PC only has the 8xxx UART :)

Are you sure? The vast majority of PCs should have a NS 16450, which tops out at about 19,200 BpS or a 16550 (probably the 16550A, which should handle 115,200 properly). The old 8250 UART that was in most XT machines topped out at 9,600 BpS.

LA> Both and possibbly as printer sharing though not sure whether
> this can work at all. One could always covert to some other file
> format (image?) then send as file and print.

My first instinct would be to look at something like Ghostscript, which can print PostScript files even on non-postscript printers. I would probably have the client machines print to a spool directory somewhere, and have a script spot the files and print them out. Of course, this may be easier said than done ;-)

LA> One thing I was wondering was if I could select Adobe Acrobat
> (installed on PC) as an application for Jinnee, so that when I
> double click on a PDF file on the Falcon, it could pass the
> parameters over to the PC and it would pull the PDF across the

I have no idea.

LA> I'm making a cartridge based type that uses a NE2000 ISA
> /hopefully/ in 16bit mode but lack of address space and
> flexability is making it tough! I'm trying to keep it down to
> a minimum of bus cycles to save time and get that kbytes per
> second up!

It's nice that you're keeping that in mind. It's a pity the ROM cartridge slot isn't more inherently bidirectional :-/ Will you write drivers for MiNT-net? STiNG?

LA> Sting 1.26 on the ST and Falcon, and from what I've heard/read
> NAT32 will do the job on the PC.

I thought you were going to use the Falcon as the router though? Or are you using STiNG to do the NAT and mentioning the PC (Windows?) one as an aside?

5666. HybridArts Midiplexer and Megafile 30

Newsgroup: comp.sys.atari.st
Date: 2001-05-05 15:43:46 UTC
From: Matthew Ritenburg <mritenburg@excite.com>
Message-ID: <ScVI6.1791$BM2.664568@news1.news.adelphia.net>
Source record: 46748

Hello,

I just added a Megfile 30 to this setup:

4mb 1040STE
HybridArts Midiplexer
HybridArts SMPTE Syncbox
HybridArts/Barefoot Editrack Platinum 7.1b
HybridArts SMPTE Track gold 6.0

Following the printed docs for the midiplexer I, I have the Megafile attached to the midiplexer and the midiplexer attached to the STE. When I boot from the Megafile I get no midiplexer. When I boot from floppy with Megafile on, no midiplexer. When I boot from floppy with Megafile off - I get midiplexer.
I have searched around some and have no promising solutions. Does anyone here know the solution to this?

Thanks in advance,

Matt

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello,

I just added a Megafile 30 to my system
and it nolonger sees the HybridArts midiplexer.
I am using the AHDI driver with the following
hardware/software: 4mb ste, HA Midiplexer,
HA SMPTE Mate Sync box, HA SMPTE Track Gold,
Barefoot Edit Track Platinum. Everything was
working great until I added this Megafile 30 to
the DMA chain. I installed it per the
instructions included with the midiplexer.
When the Hard drive is powered I get no midiplexer.
Does anyone know the solution to having the
Megafile 30 and Midiplexer work at the same time?

Thank in advance,

Griffin

There is still lots of use in the music scene, cubase 2.0 and a 1040 is used
on more chart hits than I could mention!

OTOH, I wouldn't trust PC OSes that much. I've got one Windows machine, an IBM PS/2 model 90, whose communication speeds are wildly underestimated by Windows. Likewise for my PS/2 56 running OS/2. At least yours is overestimated. =)

I'm sure he knows about these already. There are problems with some of
the more recent compression methods on AVI's too, but it's difficult
to find the decompression algorithms AIUI.

It is probably something to do with the way Atari tied it in to the DMA
system. I dont have enough info on the ls02 but will have a further look,
now the red wine has worn off;-)

Cut the old chip out and put a socket in its place, then try a few wd1772
02-02s and see how you go. You WILL find most will work, but a few will cack
it. Cheaper than trying to get an Ajax. I have 2 over clocked 02-02s and
they are fine.

Snip-------

I just checked 4 drives I had lying around, 1 epson, 2 sonys, and a TEAC.
they are all correct. Pin 1 in the right spot. I am assuming that by being
in the wrong spot you don't mean that pin 1 NOT the red wire coming of the
shugart cable. What you mean by backwards is that they are orientind
differently? i.e. that the cable is a little on the short side?

5685. [ANN] NoSTalgia 1.1

Newsgroup: comp.sys.atari.st
Date: 2001-05-06 07:46:55 UTC
From: ph.gerin@NOSPAM.com
Message-ID: <1eszc2p.wuiblzemc0geN%ph.gerin@NOSPAM.com>
Source record: 46770
Cross-posted to: comp.sys.atari.st,comp.emulators.misc,comp.sys.mac.apps

NoSTalgia 1.1 is now available !

NoSTalgia is an Atari ST emulator for Power Macintosh (Mac OS 8.x, 9.X
and Mac OS X)

What's new in version 1.1

- Fixed the control key.
- Fixed the disk menu.
- Added 14 Mb memory option.
- Added ST mouse driver for Apps using LineA/VDI (GEM apps), only one
cursor (cart.img needed).
- Fixed the memory info in the freeze format (1.0 saved states are not
compatible with NoSTalgia 1.1).
- Fixed the Fullscreen mode (Mac 0S 9/8).
- Fixed Harddisk partitions creation.
- The 'Auto frames' option is now in the 'frame rate' menu.

NoSTalgia is freeware, infos and download at :

http://users.skynet.be/sky39147/

Read my other post. My 386 also had a 8xxx. It's a 486 with VLB card for serial/parallel. It's running at 50Mhz bus and stated in the specs that it will never work at this speed! I've even disabled all waitstates! This is one fast 486, roughly the speed of a DEC 486 server. I'm just looking for the rare DX120... :) Running 66Mhz bus boots for about 10 seconds only, 50Mhz is as reliable as a Win95 machine gets! Oops, OT.

I've heard that Ghostscript is slow and very buggy. I only use the PC for reading PDFs (virtually all datasheets for semiconductors are in this format) and so it was an unfortunate must to have a PC at hand :(

> write drivers for MiNT-net? STiNG?

Sting but drivers are open source under GNU license stuff. I'm not writing them though. The problem with that port is that Atari should have made a connection on the port to select a mode that lets you do your own /DTACK or /BERR. I see why they did do it like they did (to make it easier to make dongles etc) but it seriously crippled it's usefulness for other hardware.

> LA> Sting 1.26 on the ST and Falcon, and from what I've heard/read

I'm not really sure at what NAT32 offers! I'd just heard ppl talking
about it a lot! Do I need it then if I use Falcon as internet gateway?

5688. Interesing accessory

Newsgroup: comp.sys.atari.st
Date: 2001-05-06 10:55:48 UTC
From: vdjole@EUnet.yu
Message-ID: <9d3aji$5mk$1@news.eunet.yu>
Source record: 46777

Hi;
I came upon an interesting little accesory which may prove useful:
<http://atarihr.atari.org/datoteke/dimfile.zip>

It loads a floppy-disk image file (.DIM, .MSA or .ST) as a (RAM) disk drive
so programs can be executed from it, and it can write "disk" content back
into a disk image file. It can overtake an existing drive letter
(e.g. floppy A or B or any hard-disk partition). There is just a little
documentation (only in a not-very-good English) but it seems that
some parameters of the new "drive" can be adjusted and even its
boot sector executed. I didn't succeed to activate this feature.

And so I said that it would probably be quite slow to transfer sampled data
through that port- it would probably last several times longer than
actual sampling, so I suggesed a bus-connected sampler.

>and it would be very nice to be
>able to use it to transfer samples to/from the computer, but there's
>probably no software for it anyway.

If you have the transfer protocol in sampler documentation, maybe someone
can make it even if it doesn't exist.

>Ah! Confirmed then.

Excuse me, WHAT exactly is confirmed? I barely understand any German,
so if you could perhaps translate what exactly it says...

The weird thing is that I understand this page says earlier that all
GE-soft adaptors are "nicht terminiert" and indeed I can not locate the
terminators on MY adaptor- even more, the arrangement of the SCSI connector
is such that it would look very unnatural to extend the cable past the
adaptor in order to fit the terminator. Maybe the terminator resistors are in the custom
the PLCC chip- it heats quite noticeably. Anyway, I used a short (15cm) SCSI
cable and it works OK- it is terminated on disk end, for sure.

>I'll have to see if I have this file -it's a HYPertext file, isn't it?

Yes.

>...... includes a new feature that automatically provides the proper
>termination when no external device is connected, that is, when the SCSI

Ah, I see. So if there is no external device the computer terminates itself,
and if there is a device connected, it has to be terminated, or a separate
termiantor added at the end of the cable.

>Could something like this be built to be used with my GEsoft SCSI host

Probably, but I have a feeling the cost and complexity would be significant.

>>out quite a bit but it's quite difficult.
>
>Is there any advantage to using the cartridge port?

Well it's basically because every Atari machine from the ST up came with
one, so I wanted a universal adaptor, that was cheap too. 16bit transfers
will mean twice as much information compared to ACSI port or the realtek
adaptor. I'm a bit worried as he hasn't emailed me in 2 weeks now. The
only other possiblilty one could use is the SCSI but I see that as
probably being too difficult.

I was looking in my Falcon and the Epson drive with this machine (HD) is
like modern PC drives, with pin 1 (stripe) going to the pin nearest the
power connector. It's on the old ST DD drives where the pin 1 is farthest
away from the power connector. When you do relplace the drive in an ST
then the ribbon is usually too short and get's all twisted up.

I think this thread is sorted!

Hi

Just an idea here.

Is it possible to stop GEM windows from maximising to the whole screen?
Can it maximise but leave x number of pixels at the bottom of the
screen free?
I think this would be useful in combination with Appline/Start Me Up as
these get hidden and manually moving it can become tiresome.

Or has it been done already?

Yes I sometimes use my wife's PC, but mostly I use my Hades, STe and
130XE. Just cannot stay away from my roots.

>As the hardware ages, will we all be on emuators? I'm playing with
>Gemulator, it's nice but doesn't play all these games I saved..

True the hardware will age, but there are still places to buy Atari
computers and even get them fixed... My old 520 that I bought in 1985
is still going strong as well as my old 130XE, 400 and 800XL.

I have one hooked up to my STe. I have a Link II and I suggest you buy
one also. There are not too many hard drives to be found that can hook
up directly to the STe and run. Try the sites below:

I'm the guy who gave away all of my st stuff...

For the record:

I am a Systems Admin, I run IBM RS/6000's at work along with NT for file/print. Novell is around making trouble (lol) as well, but it runs well and I never have to touch it. Thank goodness cause I wouldn't know what to do :)

I like old computers, take a look at my site:
http://www.dislerdesign.com/Atari
I just happen to have way too many 8-bits laying around to keep all of that ST stuff.

As for what I use at home, yes, I use win98. It's a great OS for this sort of thing. Lot's of software, games, etc.

But I also run a linux machine for NAT/packet filtering/file serving etc. Comes in handy because my girlfriend is a web designer and she uses a mac, also on my home network with linux and win98. Yeah, I had to compile Appletalk into the kernel, but what the heck!

But the 800xl (with Omnimon, just picked it up) is setup right next to the other three...

Did somebody want to argue about ST vs Win3.1? That hasn't been done before :)

Hi Lyndon, AFAIK this has not yet been done, but it is funny you should ask since something very similiar came up on an irc chat session recently. Lp had a good idea for this, that any GEM app could perhaps check if a taskbar of any kind is running, and ask it how many pixels it needs y-wise. This would of course mean that all the taskbars out there would need to be updated to support a specific call, but it would be dead simple to do it. But it would require that some sort of basic protocol is designed for this purpose.

To make the taskbar solution 100% nice (IMHO!) I would also like to see the AES for ATARI (N.AES/MagiC) support a feature like "always_on_top", meaning that one could set a window to always be "floating" on top of all the other windows, regardless of it is focused (topped) or not. This is something that Windows (spit!) ;) already does, and I think it could be really handy, especially for the taskbar. I really like the way the taskbar in windows is always on top, so that any window will be floating behind it, instead of in front of it.

Well just some thoughts ;)

/Joakim

>I'm out of luck.
>
>Unless some of the readers here knows what to do.

According to the LC-10 manual, it is compatible with (in order of
preference):
Star: NL-10, NP-10, NX-10/15, ND-10/15, NR-10/15
Epson: LX-800, FX-86e, EX-800, LX-86, LX-80
IBM: Proprinter II, Proprinter, Graphics printer

Dipswitch 1-6 should be ON (back) for Star or Epson, OFF (front)
for IBM.

As far as I can see it is a perfectly normal Esc-P 9-pin printer
so in graphics mode any of the Epson 9-pin printer drivers should
work. BUT: The printed quality is rather restricted with 9-pins,
and you are likely to wear out the ribbons very quickly! Inkjets
are cheap nowadays and give *much* better printouts.

Regards, /Peter/

>>>all,
>>
>>They'l remove your print if you let them!.
>
>Maybe I buy one of these too then.

But note his warning - if you overheat the join it can remove the
printed track as well when you suck. For small solder blobs, I
have used a Hellerman sleeve (heat-resistant silicone rubber tube
that's meant to be expanded with a tool and slipped over ends of
braided cables to hold them in check) over the nozzle of the
desoldering tool, as that allows you to get closer to the tip of
the iron and increases the sucking power as it forms a near
air-tight seal so that the full power of the sucker is directed to
the solder blob. Of course it is better to have a thermostatically
controlled iron, and even better a real desoldering tool with
attached vacuum pump - but those are expensive!

Regards, /Peter/

5718. CT2B Flash 1.41 English

I just installed the English 1.41 version of the CenTurbo II B Flash and
I was suprised to find 3 new Options in the SetUp Menu.

Blitter = Full Speed or Half Speed.

STE Compatibility = Yes or No.

Combel Compatibility = Yes or No.

I'm a bit puzzled about the Blitter setting as one is suppose to Dis-able the
Blitter when running in CT2 Turbo TOS 7.X Mode.

Can someone enlighten me on these new options?

Currently my settings are Blitter at Full Speed, STE = Yes and Combel = No.

What I like myself in the windows taskbar is that it can be hidden all
the time and just appears when you need to use it. And also the way one
can hide/unhide an app by a click on the app name in the taskbar. But
maybe it already exists, I never tried the Atari's taskbars yet.

Bye,
/Pascal/

Is it not possible just to make an auto prg that prevents the app
from using the bottom few pixels? Then the app doesn't have to
be re-written and nor does the taskbar.
Maybe you tell the app the wrong screen rez or is this a dirty way of
going about this problem? When the app uses getrez() (or whatever) then
you knock a few pixels off the real rez on the y plane. I'm no
programmer though.

Thats one of the only good points about Windows :)

At least some other people are giving it a thought! It's nice to
know not all my ideas are crazy!! :-)

Hi Lyndon

Can't remember how Appline/SMU works, been a while since I tested
them. But when one's using Taskbar, just move the mouse to the bottom
16 pixels, and Taskbar pops in front. No need to move any window that
might be in the way :-)

And my MegaST4 (1987) is still running a nice "little" MIDI studio
with no glitches. It gives me time to make tea, vacuum, and maybe even
a quick tune-up on the truck :)) Besides, it's not that the older
computers are slower, it's the files that are too big now :)) Of course I
do like my Falcon which can run the F16 Simulater with Backward III.
Gotta' go. There's a MIG on my tail!!!

Hmm. Aren't you all exaturating just a bit ?

I'm using good old solder sucker pump for years and it works O.K.
It is not perfect, but it is quite adequate to the job if used properly and
maintained in solid condition.
Problem is that people think that $10 bought them profesionall tool for the
job...

One should use hot tip and melt solder fully split second before sucking.
After done on all pins, small screwdriver with sharp edge should be used
to move all pins in order to break any remnant solder from the pin- on both
sides
(solder and component side). Sometimes extra effort is needed on power pins,
especially GND since these are connected to larger copper areas, which
prevent

pins to heat up fully.

Branko

Isn't solder braid impreganted with flux to help the flow?

Sounds like a sensible idea. Those tools for the Hellerman sleeve are
expensive though IIRC.

>Of course it is better to have a thermostatically >controlled iron, and
>even better a real desoldering tool with >attached vacuum pump - but
>those are expensive!

They're great. I was looking at the desoldering tools for big SMD chips
the other day and the tips are so expensive as they have the vacuum
attachment. Then the vacuums are expensive too (I'd just use a real one!).
I think you really have to be doing this as a profession to make it all
worthwhile unless you have bags of cash lying around.

Hello Lyndon!

LA> Read my other post. My 386 also had a 8xxx.

Very unusual, but possible.

LA> I'm just looking for the rare DX120... :)

I believe AMD may still make the 133MHz 5x86 (486 DX4 133MHz) for
embedded applications, but we've strayed way off-topic.

LA> I've heard that Ghostscript is slow and very buggy. I only
> use the PC for reading PDFs (virtually all datasheets for
> semiconductors are in this format)...

A lot of them seem to be these days. The speed and reliability
issues you mention may be specific to the Atari port of Ghost-
script. I've never used it so I wouldn't know. If your printer
supports Postscript you wouldn't need Ghostscript. If your printer
uses some other language such as PCL, you may be able to do the
same thing: have the client machines print in that language to a
spool directory, and a simple script pick up the documents and
print them out. This would depend on your client machines supporting
the appropriate printer language though.

LA> I'm not really sure at what NAT32 offers! I'd just heard ppl
> talking about it a lot! Do I need it then if I use Falcon as
> internet gateway?

Probably not. If the Falcon is doing Network Address Translation
for your sub-net, the PC shouldn't have to.

Regards,
- Andy.

If your Ajax is in a working machine I would leave it there and find
another. If the 02-02 dosen't work at 16Mhz it is not much use anyway. Altho
you could just swap the chips. As everybody said use a solder sucker but be
quick when removing solder. 2 reasons 1, the temperature can kill a chip if
it is held to long. 2, you can lift tracks. Good luck and may the force be
with you.

Yup, the orientation is correct it is that the cable is not conviently long
enough. You could remove the cable and solder in a header. Then just hack a
PC cable.

If you just tweak the system to (somehow) exclude the y-wise lowest
pixels from the workarea, then the taskbar would not be able to use this
area either.

I also suspect that different apps check for total area in different
ways. Best way is probably to check desktops work area:

~WIND_GET(0,4,deskx&,desky&,xres&,yres&)

But I think that many apps probably uses VDI calls to check xres and
yres

>>To make the taskbar solution 100% nice (IMHO!) I would also like to

Hehe, same here ;))

I think it would make sense to agree upon a protocol that would allow
apps to reserve screen areas, that would be excluded from the area
used when other apps wants to maximize the size on one of their
windows. I will mention this idea to Olaf Piesche (author of Smurf,
and organizer of the future project SSP) and see if this is a feature
that could fit in the SSP (system server protocol).

AFAIK the only thing that will be required by SSP is a multitasking OS
and shared mem, so it should work under both MiNT and MagiC.

5734. Zetnet, what's happening?

Newsgroup: comp.sys.atari.st
Date: 2001-05-07 12:29:56 UTC
From: rking@zetnet.co.uk
Message-ID: <3af69544$0$21938@news.zetnet.co.uk>
Source record: 46816

Hi all,

particularly those using zetnet as thier ISP, I have been exhorted to change to a new number: 0845 604 2018, as my present one 0845 300 2190 will become more and more unusable. When I change my dial.scr however i cannot connect and initialise, this is with both PAP and non-PAP. For once the zetnet help line have been totally useless or Atari-clueless, and it is now not clear who or indeed anyone is dedicated to helping our platform. It is a matter of great urgency as I must upload my webpage to zetnet very soon for commercial reasons. I have an account at UKFantastic but am reluctant to drop zetnet, but will be forced to if they have stopped supporting Atari, and of course, they are NOT free.

Thanks in anticipation,

Bob King.

5735. Atari emulator?

Newsgroup: comp.sys.atari.st
Date: 2001-05-07 12:50:47 UTC
From: ai063@FreeNet.Carleton.CA
Message-ID: <9d65n7ngc1@freenet9.carleton.ca>
Source record: 46818

After using Atari 1040ST and STe for 14 years, I recently acquired a PC with a reasonable amount of computing power (633 MHZ, 64 MB RAM, 20 GB HD and Windows ME.)

I would like to be able to run my Atari programs, since I have a lot of useful files and programs and I'm not sure how long my Atari stuff will continue to function.

There used to be a Gemulator program. Is there anything available now that will run on a PC with Windows ME?

Any help will be appreciated.

I've put a solder sucker down on the order form. Swapping the mobos over
isn't worth it as it's a pain to get the mobo out my main STE and it's
loaded with hacks/mods!

The thing is, when (if!) it's on the ethernet then I'll have no need for
it anyway. I rarely use the floppy drive, but one thing is I can't
install Magic as my version is on HD disks!

Maybe I'll give it a go when I have more time, might be fun.

Hi Steve,

Thanks for the reply. I have set the DMA
ID on the midiplexer as it has a 3 switch
DIP switch. I'm not sure it is AHDI as I
have removed the boot sector and SHDRIVER.SYS
from my C: partion, boot my system from
floppy with out AHDI.PRG in AUTO and I still
cannot see the Midiplexer. I just shooting
in the dark at this point. Any pointers
are greatly appreciated!

Thanks again,

Griffin

FWIW I've read of a technique which involves surrounding the area of interest
with a collar, and then applying a hotair blower to the chip to unsolder it
in one go. I don't think that such a chip would survive the "surgery" that
you contemplate!

From: jonk <atari@wcoil.com>
Message-ID: <9d6cjh$m48$0@206.230.189.50>
Source record: 46823

I have an RC AeroChopper and I want to sell it but I have no idea what it's worth. I looked on ebay and saw that they are going for $80 to $120 USD but those are the PC versions. I have the RC Controller, the Owner's Manual, and a backup copy of the Setup Disk (can't find original) Anybody know what it's worth or wanna make an offer!? Let me know...

Thanks!
jonk

SSP is an initiative to make it possible to let different applications
take advantage of what other running programs can do.

I think it is possible that SSP could be suited for something like the
reserving of desktop space too.

This is a developers site, there is still no prototype to try.
However, you will see what the basic idea with SSP is.

>non-PAP.

There have been threads running in zetnet.support and the zetnet-atarians list about this! Many people, including non-Atari users, have had problems using the new number. We suspect that BT have a 'unique' implementation of PPP/PAP.

Today, I've just managed to get it working. I'd previously been using STing v1.15 with PPP/PAP on the 0808 number. Changing to the new number didn't work. As far as I'm aware, no-one has been able to connect with STing. The new number does not support scripted logins, whereas the old one did, however as far as we are aware we've got STing set up to use non-scripted logins. If STing did have a bug, then my 0808 connection wouldn't have worked surely. So it may be a combination of BT's implementation of PPP/PAP and STing not being able to deal with it.

People had been reporting success with STik2, so I downloaded that and used the default.cfg and dial.scr that Paul Williamson posted to the zetnet-atarians list. And it's working fine. I'm able to connect on both the new 0845 number and the 0808 number. Presumably, the new 0800 number that is shortly to be annonced and the Surftime number will also work then.

I had a couple of problems getting in this time, STik2 reported PPP negotation failed several times. But I presume this is normal, as I used to get similar things with STing.

What TCP/IP stack/dialler are you using?

Be aware than you won't be able to connect to this line unless you have a V90 modem.

Hi Simon,

As I suspected, little by little the cold noose of obselescence is creeping round the throats of the Atarian!!!
I'm using STING and a V90 Modem. Realistically, I think things are pointing towards IConnect and UKFantastic as a temp measure and Mac + MagicMac as a switch. I'll try STiK2, but it's all so bity and I'm a computer user not a hobbier. Thanks for the info.

Bob King.

I actually found Stik2 a lot 'tidier' than STing. You simply download the two archives STik2B and QDialer, put them in their own directories, copy the sting.prg to Auto, copy the QDIAL.ACC and .RSC to C:\, create a STIK_CFG directory and put the relevant default.cfg and dial.scr files in there, and that's it.

The config files are all together in the one directory, and you can have several dial script files and select which one to use at dial time, insetad of having to rename files and reboot as with STing. I found STing a lot messier with regard to its file and directory structure.

A lot of the variables defined in the two files can be set in either of the files, so I'm currently trying to work out how to leave all the 'hardware' config in default.cfg and all the dial-specific ISP stuff in the dial script. You could then have as many ISP's and numbers as you want and not have to change the default.cfg and select between them at dial time.

But I'm coming unstuck as, even though the documentation says that things like username and password can be set up in either, Stik complains and doesn't boot if they're not in default.cfg!

Hey, that's defeatist! As has been proved, we CAN connect to the new numbers, but some software is not as up-to-date as it needs to be to do so.

You came up against a brick wall with Zetnet support. They've always had the reputation of being Atari-friendly but in reality their staff know nothing about Atari and simply enlisted volunteer support from the Atari community. They supply an Atari 'get-you-started' pack which is more than most ISP's can offer, but again this was put together by a volunteer. However, they do have a large Atari user base, dedicated Atari NG and mailing list, so those are very good reasons for staying with then otherwise we'll get separated!

>I actually found Stik2 a lot 'tidier' than STing.

I'll second that. I have no difficulty using STiK 2 to connect to a choice of 3 ISPs, just choose the Dial.Scr you want from the dialer. I also have scripts set for different Zetnet phone numbers.

I have today mailed Zetnet to ask them to keep the old phone numbers open for Atari users for as long as possible. I'm sure they will, but you can't be surprised if they want to up-date their equipment so that they can offer up-to-date connection deals such as BT Surftime.

Are you currently subscribed to the zetnet.atarians mailing list Bob ? If not, can I suggest you join the list, we seem a bit thin on Atari users whose use Ataris right now !

(Mail me direct if you need subscription details - paulw@zetnet.co.uk)

Cheers

Paul

Following the recent turmoil over the Zetnet numbers, I reproduce
below my minimal scripts for Stik2 PPP/PAP, using a Falcon's Serial 2
port. I'd also be grateful for any
comments regarding the variables (highlighted in comments) that I'd
like to move from default.cfg to a dial script, but have been unable
to do so.

DEFAULT.CFG

```
# STiK2 config file
ALLOCMEM = 300000
SERIALPORT = Serial 2
DIALFILE = {your default dial script file}
PROTOCOL = 2
SLICE = 0
# The USERNAME variable must appear in default.cfg not dial.scr otherwise
# Stik2 aborts on booting saying "USERNAME or PAP_ID must be defined"
USERNAME = {your 1000**** Zetnet ID}
# SMTP_HOST must appear in default.cfg not dial.scr otherwise QDialer
# reports "Unknown Variable". However, this is an optional variable to allow
# other clients to use Stik's SMTP routines it seems.
SMTP_HOST=mail.zetnet.co.uk
# The following 2 variables must appear in default.cfg not dial.scr otherwise QDialer
# reports "Unknown Variable".
# Apparently, they're only used by other client programs, e.g. CAB.OVL, but are not
optional!
# FULLNAME *must* appear otherwise QDialer hangs on reading the dial file.
# EMAIL *must* appear otherwise Stik2 aborts on booting with 2 bombs and then
# "Stik magic string doesn't match".
FULLNAME = {your full name}
EMAIL={your full email address}
```

DIAL.SCR (or whatever name you give it)

```
# Dial script file for STiK.ACC
BAUD_RATE = 115200
HANGUP = ATH
PREFIX = ATW2DT
INIT = ATZ
CONNECT_WAIT = 95
REDIAL_DELAY = 2
PHONE_NUMBER = 08081405050, {or the new 0845 number, or the Surftime
number}
SUCCESS = CDWAIT
FAILURE = BUSY
```

```
FAILURE = NO CARRIER
FAILURE = NO DIALTONE
CDVALID = TRUE
PASSWORD={your password}
NAMESERVER = 194.247.47.47
HOSTNAME = zetnet.co.uk

I did this a couple of years ago, but it didn't work too well. A better
68k-programmer than me will do this very easily, just hook into the
AES/VDI trap and subtract X pixels from the return values of certain
calls. I'm not comfortable with hooking into vectors though, this should
really be done by the AES instead.

Yes, it does. Taskbar from Jo Even Skarstein can do both. It can also
hide all the running applications except one. Furthermore, you can
activate an "autohide" mode which hides/unhides applications while
switching from one to another. Very handy when windows are cluttering up
the screen.

Already done ages ago in Taskbar, but dropped in 2.0 (IIRC) due to lack of interest. I could easily add it again, but using an environment variable like Jinnee apparently does is obivously a lot simpler. Not as flexible though, as Taskbar's (and Appline and Multistrip too I guess) height is determined by the font and size used.

You would. You only subtract a certain amount of pixels when the
application asks for the size of window #0 (the background). Since the
Taskbar is the app that determine this value, it will know that the screen
really is X pixels taller than returned. It's really easy.

> But I think that many apps probably uses VDI calls to check xres and

I haven't done anything on it for ages now, actually I haven't used my
Falcon for anything but mail and news for months. Been too busy
rebuilding, modifying and riding my bike :-) Now I just have to powdercoat
the cylinders and headlight, paint the bodyworks, find a set of suitable
clip-ons and *then* start picking up girls...

Anyway, I believe I did something with those MagiC-problems, but another
problem turned up and it requires quite a lot of work to solve. I'll
probably fix it up in 4-5 months (unless I crash first). The good news is
that it already works with XaAES :-)

Yes- any fairly modern floppy drive you have will undoubtedly conform
to the modern "standard" as far as Pin 1 orientation.

However, the Epson half-height 720K floppy drives Atari used in the
ST series back in 1986-88 or so, had the data connector 180 degrees
from what we've come to expect as the "standard".

That is - the Red wire is still Pin 1, but Pin 1 is NOT next to the
power connector, it's at the other end of the data connector.

Pull the ribbon cable off a normal floppy drive, flip it over, and you
get the idea.

The problem with the cable length is that when you replace the
Atari/Epson with a standard PC style drive, you MUST flip the ribbon
cable over from its normal orientation in the Atari case in order for
it to work with the new floppy drive.

Depending on the model, the cable may not be long enough to let you do that easily, or even do it at all.

I haven't looked inside my STe to check the drive, so this info may or may not apply to that model. I know the SF314 and SF354 floppy drives, as well as the 1040ST and 520STFM were like that.

Atari had a habit of changing things "on the fly" to use whatever parts were cheapest this week, so later models may have more "standard" drives.

Are there any nest nodes still around?

I'm tempted to start it up again, but it looks like the telnet bbs
scene is pretty dead (I'm getting only 5 or 6 calls (telnets) a day, and
I've got like 15 real Atari online games available!)

(telnet to "shadow.skeleton.org", login "bbs", the worlds only
online atari st bbs :)

>time, insetad of having to rename files and reboot as with STing. I

Not so. You can have as many dial scripts as you wish with STinG, and
select between them in the dialer. Most of the variables can be moved to
dial scripts from the default.cfg file.

>A lot of the variables defined in the two files can be set in either of
>the files, so I'm currently trying to work out how to leave all the
>'hardware' config in default.cfg and all the dial-specific ISP stuff
>in the dial script. You could then have as many ISP's and numbers as

See above, but this won't help you with the zetnet problem I suspect.

Serial Port? Mine is set to Modem 2 (same set-up but no Magic).

Maybe you should use the longer CFG file. This is all I have activated in
the Default.cfg file (all else is in the Dial.scr file and although
the boot info states to configure items missing in the CFG file, Stik2 is
still activated and works here without re-booting):

CFG (use your info)

```
ALLOCMEM = 200000
SERIALPORT = Modem 2
CDVALID = TRUE
DIALFILE = 115-2458.SCR
CLIENT_IP =
TTL = 64
PING_TTL = 255
MTU = 1524
RCV_WND = 4572
PROTOCOL = 2
REPORT = 0
UP_RESPONSE = 3
YIELD = 0
SLICE = 0
```

The docs state that the SCREENBORDER environment setting is an alternative method to directly entering opening window limits into the dialog box under jinnee's "Settings" menu.

There would be no reason why other programs shouldn't also use this variable, but in any case it would not be jinnee's responsibility to limit anything except for its own windows.

It's available for quite a few platforms, the recent Atari ports were done by
Christian Felsch, but he has since dropped it (the files and so on are
available from his web site should anyone want to pick this project up).

This may have been asked already, but Chris Martin and I were talking about this this last weekend and with all the Atari telnet BBS's (Closer to Home, Assassins, Cabell, JYBOLAC's Stargate) we really should relive the NeST. Since they internet linked this should not be a problem. What would be the best way to go about this?

Proponent for reliving at least the "NeST" name,

Doctor Clu

FamilyNet Newsgate

Good news... the way around this is to do the following (which I have done with many formats)...

1) Setup a floppy drive so that the Atari 8 sees a ST folder on the hard drive.
2) Place the ATR in the ST folder.
3) copy the ATR image onto a Atari8 virtual floppy
or
copy the ATR directly off the ST folder.
4) Use a ATR conversation utility in the Atari8 environment.
5) Copy from the ATR image (whereever you have it) to a blank floppy or virtual floppy.

Volla!! Converted floppy from ATR to DI format!! :)

(of course there is a ATR to DI converter.. but it is for the PC.) :)

(Anyone tried this utility under PC Ditto? HEY GAMER!!) Hehehe...

Talk soon,

Hi Jo

>Anyway, I believe I did something with those MagiC-problems, but another
>problem turned up and it requires quite a lot of work to solve.

I'll see how it gets on with Magic 6.01 as appline annoys me sometimes, I
fel start me up is fine. The all in one approach of Taskbar sounds much
beter though.

>I'll >probably fix it up in 4-5 months (unless I crash first)

Hey take it easy this time :)

>The good >news is >that it already works with XaAES :-)

Damn, I promised myself I'd try to play with XaAES when I had a faster
machine. Actually rather than using my IDE drive I could use a zip disk
and hold down the partiton key on HDDriver bootup. It was painfully slow
on my STE. :-(

5797. ForSale - ATI Rage Pro for Hades

Newsgroup: comp.sys.atari.st
Date: 2001-05-08 15:17:22 UTC
From: Lonny Pursell <fatal@SYNTAX.ERROR>
Message-ID: <Pine.MNT.4.10.10105081511560.99-100000@Hades060>
Source record: 46742

I have an ATI Rage Pro gfx card setup for the Hades that I'd like
to sell. It was purchased directly from Medusa back in November,
and I used it from Nov 2000 to Apr of 2001.

This is what I originally paid for it:

```
USD| CHF
129.97| 230 ATI Rage Pro graphics card + Medusa bios update
67.81| 120 NVDI 5.x drivers (not the full NVDI 5.x package)
-----------
197.78| 350 Total original cost
```

Note: I do have the original ATI bios chip, so the card could be put
back to it's original state.

I wish to sell it mainly for 2 reasons. There is no Video Mode Generator
and the one included with NVDI 5.x does not work with it. I have
a really cheap 17" monitor and most of the modes or scan rates used
by the card are not very compatible with it. The Rage installer
writes out a NVDIVGA.INF file with fixed modes for all bit planes and
as far as I can tell no way to adjust/tweak them whatsoever.

Please see this page for the supported modes:
http://www.kingx.com/kingx/medusa/thes.html

The other problem was related to TC modes. I found them to be unstable,
yet the machine would run all day in monochrome or 256 colors modes.
It's my personal opinion the problem is the drivers, or some problem
related to using them under MiNT+N.Aes.

While I'm being honest here, the virtual modes do not seem to work.
It also lets you select 16 color modes, but there is no 16 color
driver. These were trivial to me.

If you have a better monitor than me, or different setup perhaps you
will have better luck then I. I replaced the card with a Mach64
for those that are curious, and I VERY happy with it. I do not
wish to wait around for a driver update, unless I cannot sell the
card then I have no choice. ;-)

I will let it go for $150 USD (firm). For an extra $5 I'll ship it
anywhere in the USA, for $10 I'll ship it anywhere outside the USA.

Without trying to sound too crass, it's worth absolutely nothing and
you'll probably be wasting your time trying to sell it. Newer versions
of this emulator (3.0 and 2000) are available for free on the author's
website at http://www.emulators.com

The fact that it there are much better 8-bit emulators out there, also
available for free, will undoubtedly work against you as well.

Sorry for the bad news. Good luck.

This is what most are experiencing. Maybe it's worth a call to Atack but
this program was developed on Mint, so maybe Magic is at fault (surely
not!). It did work on my old setup which I feel was using an old
version.(something like 1.4 maybe?)

Yes, and gemulator 2000 is faster, than all other emulators together,
because of it's optimized assembler kernel. It provides a good
hardware emulation, even of such things like harddisk and floppy - you
can use the native pc floppy drive! The only thing is, that it does
not work well with german keyboards... :-(

> PS. It's getting on a bit.

Then I know how it feels! <grin> If you can configure your client machines to print using appropriate commands (EscP2?) to a file in a shared directory, then it should be possible to write a script to pick up those files and print them out. It's the same theory, just a different "printer language" than PostScript.

LA> Ahh is that what NAT stands for! I guess I don't need
> it then!

Probably not on the PC, but you might want it on the Falcon to make your sub-net use a single IP so far as the outside world is concerned.

I picked up on the networked printing aspect of the original post. I think I've used XPDF on unix (with X) before. I'm not sure how current my version was though, it didn't seem to render Acrobat documents in colour. That may have changed now, and wouldn't be an issue for some applications in any case.

FamilyNet Newsgate

Hello Jeff!

JM> Are there any nest nodes still around?

I don't know. I had heard that NeST had closed, but perhaps
some of the old NeST nodes are still around.

JM> I'm tempted to start it up again, but it looks like
> the telnet bbs scene is pretty dead (I'm getting only
> 5 or 6 calls (telnets) a day, and I've got like 15
> real Atari online games available!)

I don't think BBS were ever about on-line gaming in Britain,
probably because we had to pay per minute, even for local
calls. It was never my emphasis anyway, echo conferences
were.

Regards,
- Andy.

I use aFTP 1.55 without problems on my Falcon (Afterburner and NOVA
graphic card) with MagiC 6.01 and STinG 1.26. Very strange.

Do you or anyone else have any links to good 8-bit emulators?

Hi,

Did anyone order the "Little Green Desktop CD-Rom 1" from
http://www.fatal-design.com/desktop/

& it actually arrive????

My cheque was cashed months ago and now I cannot get a reply from
rich@atarist.com and was wondering if anybody else was having similar
problems?

Thanks

Andrew Gaunt.

I use to connect in IRCnet through irc.stealth.net but since some days ago
i'm not able to do it. Does anybody know another public IRCnet server or any
other way to get in the Atari chanels in IRCnet?

Thanks.
D Galvez.

I would like to know that too. I'm behind a Firewall at work that prevents me from going to irc.stealth.net or irc.funet.fi. I can, however, log on to Dalnet servers but can't get to the Atari channels from there obviously.

Joshua.

On 8 May 2001 09:49:42 G, John Garone wrote:
>Serial Port? Mine is set to Modem 2 (same set-up but no Magic).

Hmm, I see what you mean. But I don't think it mattered - Qdialer was interpreting it as and displaying Modem 2 anyway. I've now changed it to Modem 2 in the file, and the only effect that's had is to cause Stik to display an error message on booting! "Conf Report 0 Stik Report 0" or something like that.

>Maybe you should use the longer CFG file. This is all I have activated in
>the Default.cfg file (all else is in the Dial.scr file and although
>the boot info states to configure items missing in the CFG file, Stik2 is
>still activated and works here without re-booting):

OK, I'll try your version, although I was only following the documentation to the letter to remove items that were not necessary. So you reckon when Qdialer reports unknown variables and when Sting reports items missing, it's OK???

I've just tried my own scripts again, moving the handful of variables I had left, into the .SCR file but it's still causing Stik to crash on booting. Anyway, I'll try yours next.

Well, spookily enough, it worked!

It's definitely a bit disconcerting though for Stik to report
"No USERNAME or PAP_ID - configure one or both and reboot system",
and then for Qdialer to report 3 unknown variables! But at least no
bombs, which also means that some of the variables that were quoted as
being optional, or if not set would be given default values, are not
actually optional. It's no wonder I find cionfiguring things
difficult - things the instructions say are OK are not OK, and when
you get error messages it's actually OK!

> linked this should not be a problem. What would be the best way
> to go about this?

Ask the sysops, and potential users what they want from a new Atari
Network. I have my own ideas, but it would mostly depend on the
sysops. A decision should be made early on whether to use Fidonet
or Internet technologies. Fido style software can be made to work
over the Internet, and may hook neatly into the BBS software the
remaining sysops are running. Internet software may be more
sustainable, and more convenient in some other respects.

GG> Proponent for reliving at least the "NeST" name,

I enjoyed my time in the NeST echoes, but a new network of telnet
BBS wouldn't really be NeST - why not think up a new name?

Regards,
- Andy.

>I have an ATI Rage Pro gfx card setup for the Hades that I'd like
>to sell.

I may have been interested in this, but first could you check with Medusa as to whether the card will work in any other Hades than your own. I think you will find that it is linked somehow to the serial number of your TOS and so cannot be used in another machine.

(I would have liked to use a Mach 64 myself, but it has a conflict with Cubase and so is of no use to me.)

Also, I would only want the Rage card in order to use it for True Colour as I don't have that available at the moment on my ET2000, but as you say it is unstable, maybe I would have to see if better drivers could be made available.

Cheers

Paul

5826. Nordic Atari Show in Malmoe, Sweden 16-17/6

Newsgroup: comp.sys.atari.st
Date: 2001-05-08 21:48:10 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3af877482c434f1@tripnet.se>
Source record: 46600

The seventh annual Nordic Atari Show (NAS) will take place in beautiful Malmï¿½ this year. Malmï¿½ is located in the far south of Sweden. Atari enthusiasts from all over the country and abroad will gather together and participate in or just visit the exhibion.

The show is opened 16/-17/6 and we welcome anyone to join the show. Entrance fee is SKR 50/day (appr. 5 EUR).

16/32 Systems from England will be there selling all kinds of Atari products. If you want to buy anything special please contact him on nick@1632systems.co.uk in advance or visit http://www.1632systems.co.uk/ ... He really needs to know what stuff to bring...

There will also be second hand Atari computers, monitors etc on sell. Please contact bebbe.adolfsson@swipnet.se in advance for availability of any specific item you would like to get.

If you want to sell anything yourself just bring the stuff with you. There will be plenty of tables available at no extra fee!

We plan to do a lot af networking this year so bring your Ethernet adapters, nullmodem cables, MIDI cables, etc to join the network.

As Malmï¿½ is located close to the main European continet we hope to get visitors from Denmark, Germany, Poland, etc too. And, thanks to the new bridge from Copenagen it's very easy to get there!

For more info browse to http://www.sak.nu/ and click on the "Nordic Atari Show" button. Info in English can be found further down on the page, maps included.

Source record: 46601

```
>
> Hi Griffin
>
>
> What ID's do you have set for what
>devices, what Host adaptor are you
> using?.
>

The host adapter is built into the
Megafile 30. I belive it is an Adaptec
4400 which does ACSI->SCSI->RLL. The
Megafile 30 is a drive manufatured by
Atari for the ST. In side the unit is
a an old SEAGATE 30Mb Rll drive. The ID's
in the host adapter are 0 and 1 as it
can handle 2 drives. The Midiplexer
has a 3 switch dip switch. I'm assuming
it is binary in that all switches off = 0
and all switches on = 7. I have tried
the Midiplexer as ID 2 and ID 7. The
midiplexer works with my sequencing
software as any ID as long as the Megafile
is not powered. I have considered setting
the Megafile to different ID's and using
CBHD to boot the different ID's.

Thanks again for your input.

Griffin

Hello Dr..,

Yes I have tried the conversion program (ATR to DI) that works on the
PC on my Hades under SoftPC. It did not work. Gave me some sort of
error. That conversion works great and I have asked the author to make
a TOS version. Seems kind of strange that it runs on the PC only.
Luckily I have a wife who loves the PC world, so I use hers for that
reason.

Explain your steps again. How does one setup a floppy drive so that the
8-bit sees a ST folder? Are you using Xformer and the Xformer cable?

ATTENTION RETROGAMERS, COMPUTER COLLECTORS, VIDEO GAME FANATICS!!!!

WE'RE BACK!!..

CCAG 2001
(Classic Computer and Gaming 2001)

If you like collecting old computers, video games, and enjoy using them
still, then come join us on:

June 30th, 2001
9AM till 6PM

National Guard Armory
IT'S ON ROUTE 57!!!

(actual address)
3520 Grove Avenue
Lorain, Ohio 44055-2048
(On Route 57, going North of I-90/Route 2)

IT'S FREE!

Both vendors and attendees!
Computer User Groups and vendors inside, flea market outside!

5,000 square feet of indoor space and an additional 5,000 square feet of
outdoor space is available along with ample parking.

Setup: 29th, June, 2001
6PM-10PM

Please Call Ahead for Reservations:

Jim W. Krych jwkrych@n2net.net
440-979-9295
Fred M. Horvat fmh@netzero.net
440-286-2566
And these other CCAG 2001 organizers:
Thomas J. McLaren sirthomas@uk2.net

Please visit this site:
http://tomheroes.com/ccag.htm

As of 05/08/2001
User Groups:
Erie PA Atari Group
TI Chips

Cleveland Classic Atari Group

Vendors:
1632 Systems-From the UK!!!
C.S. Vintage Games
L.R.O. Computers
Tomorrow's Heroes
Retropolis
Songbird Productions
Video Game Connection
Ramcharged Computers

People/Organizations:
David S. Brain
Fred Wagaman
Harry Dodgson
Alan Hewston
Thomas Mclaren
Michael White(Bally/Astrocade)
Classic Gamer Magazine
John Litva

Possible Attendees!!!
Atari7800.com

Special Guest!!!
Pitfall Harry

We are looking to do a "Classic Game Experience" this year!
One room is going to be set up for playing classic computer and video game cartoons and commercials. The other room is going to be an emulator room-MAME, etc.

We already have one person bringing a Crazy Climber cocktail arcade game, John Litva. And, another vendor has promised to bring several arcade games as well. Please email us if you wish to bring an arcade game to the show.

We have a food service this year! The wife of one of our organizers, will be providing food, soda, and such!

Attention Atari ST/Falcon/TT users!!!
If you want anything from 1632 Systems, please contact:
Nick Harlow
http://www.1632systems.co.uk/
http://catalog.zen.co.uk/actinic/1632Systems/

See ya at the CCAG!

>Ciao, Eick

Hi Eick

I think you have something wrong in your paths config. Have you
enabled a downloadpath? One way to test if it's the paths, is to
download a file via D&D. Just drag the file from aFTP's window to
your harddisk and then it should work.

Sting or Stik2 ??? I may have confused the issue by mentioning
dial.scr instead of Stiks dialfile! Sorry about that!

It seems that "unknown variables" are'nt executed (dialfile).

Terve Juhani,
Mario Becroft produces 'QWERTYX', an adapter you can
plug in an AT keyboard and serial mouse. PS/2 keyboards/mice are supported
with an adapter. Here's a link to his page.
http://gem.win.co.nz/mario/hardware/qwertyx.html Take care.

Joshua.

I'm pretty much forced to use a PC at work but I recently installed MagicPC on my workstation and it runs nice and smooth. I would like to browse the internet using CAB. I am on a LAN here and dial-up is no option. Is there any way I can utilize the LAN for internet connection in MagicPC? Thanks.

Joshua.

5843. Desperately Seeking .YM Tracker

Newsgroup: comp.sys.atari.st
Date: 2001-05-09 15:41:08 UTC
From: christophertumber@home.com
Message-ID: <3af9639a.8225820@news>
Source record: 46627

I'm looking for a .YM editor/composer/tracker. It needs to save to plain .YM files. Everything I've tried so far (ie: Chipmon 2, Sidsound) saves to some alternate format.

I need just .YM, it doesn't have to have a zillion features, a pretty basic tracker is just fine.

Alternately, I have .xm2ym and snd2ym converters so either of those formats would be okay too. Alternately if someone has a utilty to convert Chipmon 2, Sidosund, etc files to .YM that would work...

Any suggestions?

Chris...

5844. Lots of 520ST and 1040ST Stuff for sale

Hi,

Having recently upgraded, I have the following surplus
items available for sale:

Mega STE - 4mb, 540mb internal HDD, HD floppy.
good clean condition. 95ukp

STE - 4mb. DD floppy
good clean condition. 40ukp

Matrix Coco Graphics card - suitable for MSTE/TT. Fits in
VME slot. 1mb. Takes standard 15 pin monitor D plug.
Complete with instructions, installation disk and
NVDI 2.5/4. 60ukp

Atari SM125 B/W Monitor - Good clean condition. Excellent picture
25ukp

Phillips CM8852 Colour Monitor for Atari. Very good picture
25ukp

External Floppy Drive - DS. 10ukp

I'm in Aberdeen but can arrange carriage within UK mainland
Allow 5ukp for small items, 10ukp for larger items.

Try me with an offer for a package!

Martin Holmes

Possibly.

A detail which may be interesting to someone who wants to use *.ST disk
images: dimfile docs say .ST format is the same as eCopy's .DIM image.

5852. Apple II version

Newsgroup: comp.sys.atari.st

Hello,

I put up a mock screenshot of what a port (of Westfront PC) might look like. Here it is:

http://www.geocities.com/dunric/wfc64.gif

Would anyone be interested in porting the MS-DOS/Windows to your beloved system? I've received a few inquiries from individuals willing to try, but it would take a solid month or so of free time to port a small fraction of either game. An experienced BASIC programmer could use that screenshot and code a game around it, using the colors and layout shown above. Inspector Funkydog, Faldor and 350 or so rooms could be done rather easily.

The game is in the public domain, so anyone can port it and/or use it. The source code is available here:

http://www.geocities.com/dunric/wfsource.html

Let me know if anyone is interested. It would be great to see this game on other systems! :)

Regards,

Paul Panks (a/k/a "Dunric")

Thanks Bill and David for your answers.
I was aware of a problem with the eject button, and I pull it out a bit,
but that doesn't seem to help in this case. :-(
I guess I will have to buy a new one and transfer my files to CDR!?
thanks.merci
ken

5854. Lynx II System FS

Newsgroup: comp.sys.atari.st
Date: 2001-05-09 18:39:31 UTC
From: tonym04@aol.com
Message-ID: <20010509143931.00134.00004696@ng-cg1.aol.com>
Source record: 46638

I have an Atari Lynx II for sale with carrying case, battery pack and 7 games for sale. I have the boxes for Dracula and Rampart (i think) but that is all. Asking $100.00 and that includes shipping in the US. The games are:

Dracula w/inst
Rampart w/inst
Turbo Sub
Shadow of the Beast w/inst
Gauntlet
Chips Challenge w/inst
Dirty Larry - Renegade cop w/inst

System is near mint condition and I will say that the battery pack is the best accessory for a portable i have ever used. The bigger batteries give MUCH longer playing time than the AA's.

Email me direct please.
Tony

"Always on top" is a nice idea until a Windoze app is busy or
hangs and then it is impossible to get at that portion of the
screen.

Maybe its just the way Windoze handles screen access.
I used to use one application in the office that would
crash on start-up and it would sieze the midle of the screen.
The app couldn't be killed off because it didn't appear in
the list of current apps. The only option was to reboot.

Just one question-

Does the source code absolutely, positively, HAVE to be in an html format?

Wouldn't a nice, simple TEXT file be easier to maintain, not to mention a lot friendlier to anyone who wants to import hundreds of lines of code into a text editor..?

Most of the systems mentioned as possible ports have no html editors available, so the source code has to be stripped out manually from the html page source using search and replace in a text editor. That can be awfully messy and time consuming.

Real coding would be a lot easier to get started with a simple .ZIP file (or just straight ASCII) of the source code.

Just a thought...

Like he said, MAJOR HACKING.

This isn't as simple as slipping a HD drive into an ST to use as a replacement DD floppy drive.

Can it be done? Yes.
Can it be done without major hacking? No.

5859. Composite output from 1040 ST

Newsgroup: comp.sys.atari.st
Date: 2001-05-09 20:48:03 UTC
From: Geoff Phillips <geoff@geffers.u-net.com>
Message-ID: <OPhK6.72$dp3.40604@newsr1.u-net.net>
Source record: 46642

In that past, I've used a simple cable from my old Atari ST, taking composite out (pin 2 I think) and ground, and getting a fine picture on the TV.

I've just bought a new old (humour intended) ST, which doesn't have the modulator sticking out the back, but has what looks like the standard video connector coming out. Although I can see the RGB are working, by briefly touching them to the composite in of the TV, and hear audio, I don't get anything from the Composite Out, not fuzzy, just totall absent.

I have two questions: firstly, is the composite out missing from certain 1040's. Secondly, is there a modulator I could buy - presumably sticking out the back like the Amiga one used to do. Worst case, I could wire up an RGB to the scart at the back of the telly, but I wasn't sure the TV had RGB capability, and it's less convenient to go to the back of the set.

I'm in the UK by the way.

grateful for some help

Geoff.

Sounds a bit odd that the app did not appear in the list of running
apps. And I also think that a apps that crashes should really have all
its windows closed after the crash. I don't think that this feature
would be a problem to implement in N.AES or MagiC if there were enough
interest for it.

And also, such a feature should be possible to turn off from within
well-written apps I think. That way, everybody can stay happy ;)

Hey there,

Sorry about that. The page contains a download for the MS-DOS version,
which has the source code contained within it. I will post a text-only
version of the source code right now. The text will be at:

http://www.geocities.com/dunric/wfsource.txt

Sorry for that!

By the way, the Amstrad looks like a very cool system and Westfront PC
would be awesome translated to it.

Hello fellow Atarians

This is a long shot: But I was wondering if there is any one here that are into MIDI and live in the Bay Area, CA (USA)??

The reason is because Tim Thompson (programmer of KeyKit) would be willing to host an Atari-Midi Get-Together at his house. We could showcase our pieces, play live algo-comp stuff as well as hitting the keys and generally having a good time. Everything would be recorded for prosperity.Tim Lives in San Jose, CA.He was thinking the time would be in AUGUST of this year.

Any Takers?Please feel free to email me direct :tconrardy@hotmail.com

Yes. Models which do not have the RF Modulator also do not have the
composite video.

Unfortunately I know nothing about SCART, but I seem to recall there
was a cable that would go from the RGB connector to the SCART
connector on a TV. Where you would get something like that now is
something I can't begin to guess.

You really DON'T want to go by way of an RF modulator. The signal
quality is absolutely terrible. Low Resolution games are barely
acceptable, and Medium Resolution 80 column text will make you go
blind.

Unfortunately I haven't found a good archive site with the hardware
hack text files that used to be available. It's probably been over a
decade since I've seen them.

Basically you need to provide a 16 Khz clock source to the floppy disk
controller to make it write 80 sectors per track rather than 40
sectors at the normal 8 Khz clock rate.

There is a spot in the ST which can supply this clock signal, you just
need to provide a new IC to buffer the signal (and to provide some
means of switching back normal when needed).

Some STs came with a floppy controller which was suitable, some had to
have their controllers replaced.

All those little details are the kind of thing buried in the missing
text files.

I have the following for sale:

These have boxes and documentation:
The Addams Family
Archer Maclean's Pool
Fire and Brimstone
Micropose Golf
Space Ace
The Juggler
The Duel - Test Drive II
Fastcopy Pro
Sid Meiers Pirates
President Elect 1988 Edition
Lords of Choas
Populous/Simcity Combined boxed set
LDW Power Spreadsheet
Dragons lair II - Timewarp
Alternate Reality - The City
Warlock
Wrath of the Demon

These have Documentation but no box:
California Gold
Balance of Power

Quick ST II
Leisure Suit Larry in Land of the Lounge Lizards
G+Plus
UMS
UMS II
Red Storm Rising
Blackhawks 1942
Harddrive Turbo Kit
Procopy
Leisure Suit Larry III
Monkey Island
MaxiFile
Ultrascript
Gettysburg
Populous II
Simcity
Data Diet

Conquests of Camelot
Sundog

and Spacequest II - no instructions or box.

I have a Kingsquest bundle:
Kings Quest
Kings Quest II
Kings Quest III
Kings Quest IV
Kings Quest Companion Book
I would like to keep these together

If you want any of these Email offers to Jason at stonedogjc@hotmail.com
Thanks

Andy,
The TOS stuff is on the UMICH archive
http://www.umich.edu/~archive/atari/Gnustuff/Tos/ but its getting old now.
Its also a bit of a pig to get going. If you have any trouble drop me a
note.
Dave.

If your TV has a scart socket it may already have RGB in. SCART has
connections for both RGB and Composite, and they are not implemented
consistantly. If it has RGB the only problem with connecting ATARI output to
the scart is the sync. If I remember correctrly one has "composite sync"
(i.e. H-Sync and V-SYNC on same pin) and the other has seperate syncs. I
think my scart lead has low value resistors in (33 or 47 ohm) to link them
together. Any way you should be able to find pin-outs on the NET. If you
arfe stuck I can open up my lead.

Go to the configs section of the dialer, and click on the name of the
dial.scr file that's listed at the top of this dialog box. Do what you do
with the resultant fileselector.

Each dial.scr _must_ end with the keyword DIAL-SCRIPT even if there are no
entries for this section (there shouldn't be any anyway, for a PPP
connection).

Quertyx price is NZ$150 = about $75 US plus shipping plus clone kbrd and
mouse.

My price for (TT) Mega STE kbrd is $40 plus (2kgs) shipping, standard
Atari gear.

You choose.

Barrie at Keychange.

For some reason CixRead keeps crashing when I try to do a 'com' to
Lyndon's message, so I am doing this as a 'say' and hope it
works!

In message <tfcr35lqujuf2@corp.supernews.com>, bindon@madasafish.com said:

>>You can use the braid from a screened cable or coax after you
>>remove the wire and insulation for this.
>
>Isn't solder braid impreganted with flux to help the flow?

Some is - I've still got a tin of Fluxite I bought in the 40s (!)
and dip the braid and iron tip in them.

>Sounds like a sensible idea. Those tools for the Hellerman sleeve are
>expensive though IIRC.

The normal ones, yes. But I bought (again many decades ago) a
cheap one made up basically of two stiff wires bent double going
through 4 holes in a slidable collar (like a large washer); when
the collar is in the forward position, the four ends lie close
together and you can slip on the sleeve. You then pull back the
collar and the four wires are forced apart, so you can slip the
sleeve over the wire. Then you move the collar forward again as
far as you can and slip it out of the sleeve. Crude but cheap! The
trick lies in getting stiff enough wires and bending them just so.

>They're great. I was looking at the desoldering tools for big SMD chips
>the other day and the tips are so expensive as they have the vacuum
>attachment. Then the vacuums are expensive too (I'd just use a real one!).
>I think you really have to be doing this as a profession to make it all
>worthwhile unless you have bags of cash lying around.

Agreed. Don't some desoldering tools for surface mount devices
actually use blown hot air?

Regards, /Peter/

The setup was mainly for the ST. I do not see why it would not run on a Falcon. It is run in ST medium. The hardware needs to be hooked up through the cartridge port. Too bad my Hades does not have a cart port or else I would have tried it out on that. I love mine and am glad I bought it. The program is still being made for the PC. Too bad there is not an updated version for the Atari. Still, I am very happy with mine.

OK so it's an enviroment. It can be set in Magx.inf in format
left,top,right,bottom in pixels. Basicaly so that Jinnee doesn't open
it's windows over your start bar/drive icons. So any app should look at
this and use it accordingly, it's just geting everyone using this env.

There's not much more to tell you. I don't think there is much more to it!

While it sounds like a scheme easy to use, I also see one shortcoming.
It would not allow dynamic changes to the protected area. I guess it
is not important very often, since programs like Taskbar and Jinnee
might be running through the whole session but I think it would be
neat to have a well thought out solution that could be as flexible as
possible. Else someone will probably find this restricting in the
future.

Well, just my 2 cents,

Joakim

5889. Commodore 1084D on a Falcon

Newsgroup: comp.sys.atari.st
Date: 2001-05-10 15:40:44 UTC
From: Lord Gaiyan <gaiyan@vianet.ca>
Message-ID: <KByK6.62$W02.1754@newsfeed.slurp.net>
Source record: 46672
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have the pinouts for the Falcon and the monitor, how should i connect the two together? Here's what I got

Falcon:

1: RED
2: GREEN
3: BLUE
4: MONO/OVERLAY
5: GND
6: RED GND
7: GREEN GND
8: BLUE GND
9: AUDIO OUT
10: GND
11: GND
12: COMPOSITE SYNC
13: HORIZONTAL SYNC
14: VERTICAL SYNC
15: EXTERNAL CLOCK INPUT
16: EXTERNAL SYNC ENABLE
17: +12V
18: VID MODE 1
19: VID MODE 2

Monitor:

1: GND
2: GND
3: RED
4: GREEN
5: BLUE
6: INTENSITY
7: COMPOSITE SYNC
8: HORIZONTAL SYNC
9: VERTICAL SYNC

There were some settings for the Falcon as well:

M0 M1 Monitor
0 0 MONO
0 1 VGA
1 0 RGB
1 1 TV

What do they mean and how do I set it up? Thanks.

Joshua

Those built with switching powersupplies (e.g. Stacy, Mega-STe,
TT) will, others like the ST will not, unless you replace the PSU
regulator board, AFAIK.

Hmmm, this link seems to be demised. Anyone know where to find NeST info
on the net?

I know that you can get fido net to work under linux like normal
newsgroups. I am doing some reading up on this, but if anyone has some
info on connecting to fido net (or NeST) under linux, please let me know.

Thanks,
Chris

I think so. The vacuum though is used to hold the chip so you can pull it
straight up and off the board. The whole kit is about ~1000 ukp from
Farnell!

That's a good price for a real Atari keyboard. When I said inflated
I was refering to US dealers, 2 of which want over 150 USD for
just a keyboard.

From: bindon@madasafish.com
Message-ID: <tflkocrarlck7b@corp.supernews.com>
Source record: 46679

Hi

Just installed Alexander Barton's shutdown prog under Magic and Jinnee.
I use cntrl-alt-del to do a shutdown and if I click cancel I get back to
Jinnee properly. But If I repeat this and once again the machine does a
reset. Anyone know why? It never did this with the old shutdown.

Also clicking "Parallel start" doesn't make any differnce. Jinnee still
quits from memory which is the main point of a new shutdown prog.

Maybe there is a beter one available?

Thanks.

5896. Re: Composite output from 1040 ST

Thanks for that info - it's almost unbelievable that they made these things
without composite output, so it looks like I'll try to get RGB going.

I've trawled the net for information on a lead to do the RGB route, but
without sucess. Maplin used to do a lead, but it is not listed on their
online catalogue.

I tried quickly a straight rgb and ground connection, but that didn't do the
trick, presumably I need to put a sync in somewhere too.

cheers for any pointers,

Geoff.

Hello,
In the new STC 4 there is an interview with the programmer of the
"ParadiseWeb" browser. There is also a first screenshot of
the browser. There might be a preview of the beta version in the
next STC (5). Release date for the first official version is
planned in August 2001
Stack to be used :Sting and Stik.
Features : HTML 4, Java, Javascript, etc...
Available with or without Office Suite.
Cheers
Dan

>understand it, if he is he'l pop by soon.

Yep I'm watching :-)

The manual should now be available from Atari Workshop. I've had
my copy for a month or more. Regarding $Screenborder, all it says
(in Settings... > Window placement) is:

When Use $SCREENBORDER is active, instead of the values in the
editable fields the area left clear will depend on the value
stored in the environmental variable of the same name (its format
is similar to the above* pixel values for left,top,right,bottom).
{NB - No spaces!}
This environment variable can be set in various ways. In MAGX.INF
use an entry such as:
#_ENV SCREENBORDER=0,40,0,30
which gives no spacing at left and right, 40 pixels at the top and
30 at the bottom.
------
* This refers to the 'Distance from screen edge' editable fields:
Here the distance from the Left, Upper, Right and Lower edge of
the screen, in pixels, in which windows will not be placed can
be freely defined. This makes it easy to ensure windows are not
opened over your desktop icons or open over an installed start-
or application-bar and so on.

Yes and no! You will need a 115:220V step-up transformer for the
power line, or a replacement US-voltage power supply. Depending on
what video output you use, the 50 Hz vertical sync may be a
problem with some TV sets, though most monitors will run both 50
and 60 Hz.

That should be 18 (or 20) and 9 (or 10) sectors respectively. The
first number is standard, the bracketed one extended format. Also
I believe kHz should be MHz!

Yes, but Noisetracker is playing samples, not synth sounds. And as the YM
isn't made for samples, the result isn't really the best.

However, Nosietracker and many other "digital instruments" trackers can be
found at http://www.dhs.nu/

compared to plugging a simm into an STE, if you don't know what TTL stands
for, it IS major hacking for 95% of the world. You know and I know it is a
doddle, but I don't expect everybody to weild a soldering iron with the same
degree of precision I would.

There were very few STFs compared to the rest of the STs. I think standard STs used the RF cct to create a Sync signal? Any way you need to use 6 signals from you ST. R, G, B, horizontal and vertical sync and grnd. You need a FULL scart caplable TV to use it. But you cannot use it on a Composite input unless you get a specific device to do so. You could get an Amiga external modulator and make a cable to connect that, then use the Composite port on that.

> 1 0 RGB
> 1 1 TV

OK here we go. It is quite simple when you look at the pins that are used. All you need is a 19 pin plug and a 9 pin plug. Going from the falcon to the 1084 it would be like thus. pin 1 to 3 (red), pin 2 to 4 (green), pin 3 to 5, (blue), 13 to 8 (horizontal sync), 14 to 9 (vertical sync), pins 5, 10 and 11 should all be tied to pins 1,2 and 3 (ground), and importantly tie pin 10 to 18 on the Falcon end. This last bit tells the Falcon to expect an rgb monitor. It does this to get the sync frquencies right. The m0 and m1 signals are active HIGH, which meens the input is always a logic 1, if you look at the table above you will see that if nothing is plugged in it will expect a Tv. Which is good as the TV cable uses a seperate port. Clever eh;-)

This would be nice but, I just visited their web site and the project
has been put off. They state a programmer had left the group but
according to the auction on Ebay a person is getting rid of Paradise web
designs Atari items due to them leaving th atari platform..

Heh... I remember "participating" in one of the first ST memory
upgrades here in my area...

We did one of the early "hot glue a second row of chips on top of the first row, UPSIDE DOWN so the legs stuck up like a gang of dead cockroaches, then wire wrap the legs in parallel (mostly)" upgrades.

Gave us a blazing Meg of RAM though!

It was a while before we got up the courage to solder the top row directly onto the bottom row (I don't remember who the brave soul was who risked his ST "for the cause" that first time).

That took a while too... just like with the wire wrap, you'd do a row or two, then have someone else take over while you went and put eye drops in your eyes so you could go back and solder some more.

It turned out to be a real team sport!

Yeah.. nothing like popping in SIMMs.. :)

Thanks for that, I could live with just RGB, but looking at a Scart pinout, there are no obvious sync inputs at all, and a site suggested vaguely that when using RGB, one has to treat the scart's composite input as a composite sync input, but heavens surely this ought to be on the Quick FAQ.

None of the video links remotely seemed to give this information, which instead of giving answers, have hyperlinks - which is a deadly thing for a FAQ to do, because hyperlinks are so often broken, or do horrible things.

What do other people do, surely Atari ST F owners use RGB with their TV's?

Geoff.

I've got a soldering iron like that, you heat it up in a gas flame ;-)

Hope that that flux isn't acidic...

>>I think you really have to be doing this as a profession to make it all
>>worthwhile unless you have bags of cash lying around.
>
>Agreed. Don't some desoldering tools for surface mount devices
>actually use blown hot air?

Yes. You can use one of those hotair guns that are used for paint stripping,
but the big problem is preventing surrounding components from coming loose
when you tap the PCB to shake off the target component.

What is plain .YM?
It's a PC format, that's what it is, and is essentially a dump of the entire soundbank. Not really the kind of data which you'd enter into your favourite tracker and re-edit. .YM files are created by dumping certain registers straight out of the ST's memory into a file, and that's how you would go about creating them in this case, too.
IOW, every ST sound app which uses the YM2149 uses the YM format, but only internally. Since it's a bloody stupid format, no self-respecting program would use it.

RGB monitors are cheap as chips these days. I have 4. and 3 VGA;-). But you
really want to try the Amiga modulator trick. There are proper Atari
modulators avaliable but only seccond hand now I guess?

11.05.2001 - News Melder: Thomas Raukamp - [top]
ParadiseBrowser auf Eis
Es wï¿½re ja auch zu schï¿½n gewesen: das Office-Paket OfficeSuite inkl. dem neuen Webbrowser ParadiseBrowser liegt vorerst auf Eis. Nach Angaben der Website der Entwickler haben wichtige Programmierer das Projekt verlassen. Von Anwendern wird gemeldet, dass Paradise seine Atari-Hardware auf den amerikanischen eBay-Seiten wg. Systemwechsels verkauft.
Von Paradise Webdesign erhielten wir noch keine Erklï¿½rung zu den Vorgï¿½ngen.

Hi all,

Thanks for the responses to me sale of the SM124.

I am now trying to help a friend, who picked up a STF, of course it doesn't have the modulated output.

Another friend of mine has an old 'Cub' monitor, for which he made an adapter lead some years ago, and was going to sell to my other friend. Trouble is, he has lost the lead.

I am looking to buy either an adapter lead for the 'Cub' or a colour monitor for the STF.

Unless soembody has the instructions to make the lead (ISTR it was published in an ST magazine some years ago).

Cheers.

Hi All!

I was wondering if there was anyone out there who has installed Debian Linux 2.2 on an Atari TT030, and who has managed to get Xwindows working on the stock Atari video hardware. If so, can you let me know how to do this?

Since I have installed Linux on my TT, several people have asked how did I get Xwindows working. Well, I didn't, and after messing with it for a few days, it doesn't seem like it is too easy to do. If anyone has modelines for the XF86Config file that work, that would also be helpful.

Thanks,
Chris

Hello

Well, i'll give you a very simple answer to your question.
Yes everything is possible.
But don't forget price and disponibility.

1)You need of course a new power.
It still exist in the usa the" best electronic shop"
so i thing is more simple to change this .
or use 110 to 220 volt transformer.

It is useful to have a traveler kit : with all the
adaptator for electrical connector.:-)

2) For vga screen or rgb monitor, it is easy.
It still exist soft utility for switch between 50 or 60 hertz:-)
It is useful to run americain prog in europe.
(I remember my special spectrum 512 from usa for ste)
And of course it is useful to run europe prog too.

Of course, you can use this only to overlay the possibilty
of your graphic chip onboard:-)

3)If you have rf connector too.
Ste and falcon.
It is different , because the quartz for pal is not the same as the
ntsc.
So, "best electronic" buy a new quartz or simply use tv with ntsc+pal
possibility.
(I not sure that the model ntsc is compatible with the japan ntsc :-))
But for the usa all is ok.
For the pal it still exist 2 differents pal too .
The english and the german pal, the diffï¿½rence isn't for the picture
but for the sound hf.

For the sound alone it is international :-)
And for the midi too....
and of course for all the add-on which use the power of the computer;

Maybe the best choice for today:the milan.
A new cli¿½ne atari, with power of personnal computer
and standard graphic pci card....

bye!
do the good choice, choose original tos computer or cli¿½ne???
i can't decide for you!

5933. Re: Shutdown

Hi Lyndon

>Just installed Alexander Barton's shutdown prog under Magic and Jinnee.
>I use cntrl-alt-del to do a shutdown and if I click cancel I get back
>to Jinnee properly.

I got around that by assigning Alt-F4, its seems that C-A-D drops
through to TOS somehow and does as its expected.

>But If I repeat this and once again the machine does a reset. Anyone
>know why? It never did this with the old shutdown.

I think its poxed.

>Also clicking "Parallel start" doesn't make any differnce. Jinnee
>still quits from memory which is the main point of a new shutdown prog.

It works OK here, ive got the shutdown dialog sitting in the background
now. Just for the hell of it, install it as an application and elect
parallel start there.

>Maybe there is a beter one available?

Ive got Version 1.6, i like the option to have a utility installed in
the user button so i put X-Boot in there.

Please use the enclosed email link within this post rather than your reply button, email not properly addressed may not be able to be responded to.

Last Updated 5/11/2001
- Sold/Traded Items Removed

I have a limited amount of brand new Atari Jaguar items for sale or trade (these are not refurbished units). These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

Due to all the game titles being in short supply, all titles with the exception of CyberMorph are available only with the purchase of a Jaguar game system.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NO.SPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NO.SPAM. first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25

** Atari Jaguar Accessories - New**
==========
- Team Tap (4 Player adapter) $20 - (Limited Supplies)
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $15
- Spare Controller $15 (Limited Supplies)
- AC Power Supply $10 (Limited Supplies)
- RF Switch Box $5 (Limited Supplies)

** Atari Jaguar Games - New/Shrink-wrapped**
==========
Due to all the game titles being in short supply, all titles with the

exception of CyberMorph are available only with the purchase of a Jaguar
game system.
- Checkered Flag $10
- CyberMorph $5 (No Box)
- Kasumi Ninja
- Tempest 2000
- Troy Aikman Football
- Wolfenstein 3D

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues
12 thru 20

Well done, Lyndon.
I don't know of any other Atari software that is more comprehensive in
the formats it supports, so it's Aniplayer or a different platform
entirely (if you can stomach it).

On 10 May 2001 06:46:36 , David Johnson wrote:
>Will Atari computers sold for overseas markets (like England or Germany)
>work in the United States?

Yes, but there may be a problem with the fact that overseas the
computers put out a 50mhz video signal, while the US computers put out
a 60mhz signal. Still, I think this can be fixed by running the
computer signal through a video converter and then out to a VGA monitor.

You don't need any modelines for the Atari because the frame buffer
device is used. Most of the data in XF86Config that deals with monitor
settings is not relevant for the TT.

Whether you have to do that does not depend on the age of your Atari but
on your SCSI host adapter.

Sure. When I had a brief look at the article on the project recently it was clear right from the start that it would never be finished. Some people are simply dreaming that the Atari market still has sufficient potential for projects like this. But this is obviously wrong. There are hardly any developers left, there is no money for such projects, and, eventually, there are also not enough users left who would pay for the software. That's the way it is. The XTOS project will go the same way.

Its only a software issue and only affects RGB monitors. The screen
frequency is 50Hz Pal and 60Hz NTSC. All you need is an auto folder patch if
you are that worried by it. The Falcon and TT just need their Nvram
modified (simple).

>>standard Atari gear.
>
>That's a good price for a real Atari keyboard. When I said inflated
>I was refering to US dealers, 2 of which want over 150 USD for
>just a keyboard.
For a *really* good price one should order these keyboards from a German
dealer. Brandnew MegaSTE and TT keyboards with German, French or English
keycaps are sold for 39DM ($19).
Shipping by UPS ($12), payment with credit card...
http://www.seidel-online.de
mailto:info@seidel-online.de

AFAIK Keychange sells keyboards with Spanish keyboard caps but conveniently
forget to mention this.... :-/

Cheers from Belgium
Dennis

Hi Paul,

>I for one am delighted to see an ISP prepared to continue to actively
>support our platform. I shall continue to support them as long as they
>do !
In what way is Zetnet so dedicated to/for Atari? Do they have an Atari
helpdesk or give setup scripts for Stik/STing, MinTNet, Iconnect etc... ?
I can see the usefulness for someone new to internet, but once one becomes
an experienced user, what's the advantage over a different ISP. As long as
one can log in and reach the various servers, I would say any ISP is just
fine provided the quality of the connection, bandwidth, service and price
is right...

Cheers from Belgium
Dennis

Hi

It depends where you live and your host name. If you are in the UK there
are: chat.bt.net 6660-6670
ircnet.demon.co.uk 6660-6669
irc.netcom.net.uk 6660-6663,6667

there are also irc.missingU.com which is aimed at the usa, but i've
logged on with no problems.

You can get a list of servers, which is updated, somewhere on the
following web site:

http://www.irchelp.org

I'll leave it then. I'd rather keep it as c-a-d as I'm so used to it and
it's very rarely that in one session I do two cancels on the shutdown.

>>Also clicking "Parallel start" doesn't make any differnce. Jinnee

Well I'll see if installing as an app gets around this problem but just to
prove a point.

Thanks.

Just getting your shell set up properly. I use GULAM which is a bit old and
have the following set on my gemulator system.

setenv TEMP c:\temp
setenv PATH c:\gemula~1\gccbin,c:\gemula~1\gulam,c:\gemula~1\bin
setenv GCCEXEC c:\gemula~1\gccbin\gcc-
setenv GNULIB c:\gemula~1\gcclib
setenv GNUINC c:\gemula~1\gccinc
setenv GXXINC e:\gnu\g++-inc
setenv UNIXMODE 'd/brG'

Tricky ones are I think GCCEXEC and UNIXMODE

Also by default output is called a.out. copy or reanme to your program.

Drop me a mail

Geoff,
Most STF users probably also have the ubiquitous Phillips CM8833 (I think thats the correct number) monitor, complete with scart lead. I still can't find my lead, but I am in the middle of moving stuff from loft to shed and back, so it should turn up soon as I unpack.

Dave.

5954. Old Atari ST 1040 to Scart Telly, solved.

Newsgroup: comp.sys.atari.st
Date: 2001-05-12 14:15:13 UTC
From: Geoff Phillips <geoff@geffers.u-net.com>
Message-ID: <0obL6.1$t41.2563@newsr2.u-net.net>
Source record: 46589

Just in case someone wants to know, I managed to get the beast wired to the television, using the RGB. The details are:-

1) The SCART needs sync on the composite input.
2) The horizontal and vertical sync from the ST connect to each other with a pair of 330 Ohm resistors, and the point at which those meet is tapped off to pretend to be a composite sync, and off to pin 20 of the SCART, the red green and blue and grounds going directly from the appropriate pins.

[If you just use horizontal sync, you get a rolling picture, but otherwise ok.]

So..

ST vert sync - |--330R-|---|||SCART composite In |||-330R--ST horiz sync.

Gives a sharp image, no glitches. Don't blame me if it doesn't work! (but does for me).

Thanks to those who offered assistance, feel free to add it to FAQs. I can't recall now where I gleamed the bit of information about the 330Rs, perhaps nestled inside a Dejanews posting.

I think I have one if you can't find one. I certainly have some Acorn ones
tha work fine except the face plate is differnet. Yes, I do have the
Epson ones actually as well. If you do want one I'll check them before
they go.

Right, but my question is, how do enable or disable the
parity-checking on my Quantum LPS340S SCSI drive? Some of the Quantum
drives had jumpers for doing this, but the LPS340S doesn't have them,
it only has jumpers for setting the SCSI ID number.

I'm pretty sure that when I had this drive put into the Atari, the
technician that did it told me he used some kind of utility to either
disable or enable the parity checking on the drive, but that company
is no longer in business.

Dennis,

This would be a useful link if you took up directly to the Atari keyboards.
Since my German in little to none. It took my a few minutes to find PC
keyboards but NO Atari keyboards. Post a link that the keyboards can be
found.

Don

Most Quantum drives provide for changing this settings by software. You
have to connect the drive to a computer where you can change this
settings (e. g. a Falcon or TT). Than you can connect it to your ST/STE
again.

> I'm pretty sure that when I had this drive put into the Atari, the

HDDRUTIL (->HDDRIVER) can change this setting.

Persevere with the Cub, they work well with the ST. I modified one some years ago but I have recently given it away so can't check back on the connections.

There are other things which need doing to a Cub if it was last used on a BBC micro (change to analogue RGB, change polarity of one of the syncs.), these are all done by jumper on the main board but have prob. already been done if it was used last on an ST.

You will get a good idea of the pin connections if tou look inside the monitor as the leads from the plug are sensibly colour coded (R-red, B-blue, G-green, Ground-black - then there are the syncs. which, IIRC, are yellow and white).

There is a useful pad at the back-left of the monitor main board to which to could connect a Brightness control if you wished. On the Beeb the only external control was Contrast.

Yes, my friend set it up to use with his ST.

I don't think the pins were the problem, but isn't there a need for some
resistors in two of the lines to set the sync's.

Cheers.

Source record: 46502

Hi!

I just thought I would try out Spin! for curiosity sake. However, I can't get it to recognize my CD-RW drive (Yamaha). CD-Lab doesn't seem to recognize it, either. Both act as if the drive doesn't even exist in the SCSI chain. CBHD seems to see that it's there, though, so my guess is that it isn't supported by Spin or CD-Lab. Can anyone confirm this? I have ExtenDOS, so it's not a big deal. I just thought I'd try it out. Thanks!

Maybee a problem on your scsi chain or trouble with some drivers.
Any scsi device shold send a message while boot up sequence.

> it isn't supported by Spin or CD-Lab. Can anyone confirm this? I have
> ExtenDOS, so it's not a big deal. I just thought I'd try it out. Thanks!

Yamaha Recorders supported by ExtenDOS.
SPIN is an driver for CD-ROM devices.

ExtenDOS is the ONE and ONLY driver i used since 3 years for Toshibx
XM53xx CD-ROM devices and an YAMAHA CDRW 4260. Any other are not need.

CONFIG.SYS from CD-TOOLs / SPIN:
(Use SPIN for read only from Yamaha device!)
(Also works with .xfs for MagiC)

```
; CD-Tool / SPIN Configurationsfile BEGIN
; Note that everything up to `; CD-Tool END' will be erased by
; CD-Tool's configuration tool!
;
; created by CD-Tool 2.08, Sat Jul 12 13:47:20 1997
;
; devices
;
; SCSI 6: `TOSHIBA CD-ROM XM-4101TA' -> P
; SCSI 3: `YAMAHA CDRW 4260' -> V
;
; BOS drivers
;Load CD-TOOLS device driver hs-cdrom.bos
*BOS, c:\auto\spin_sd.bos, P:14
*BOS, c:\auto\spin_sd.bos, V:11
;
;Load SPIN device driver spin_sd.bos
; DOS drivers+
;
;Load .BOS device driver for SPIN and CD-TOOLs
*DOS, c:\auto\hs-iso.dos -c16, P:P
*DOS, c:\auto\hs-iso.dos -c16, V:V
;
```

```
;
; Config.sys An ascii file that describes the system
configuration.
;

; Physical Basic operating system format
;*BOS, [Physical Bos driver][Arguments], [Physical id]:[DMA channel],
...
; Device # meaning
; 0 - 7 ACSI device 0 - 7
; 8 - 15 SCSI device 0 - 7
;
;The next line installs FALCON.BOS for SCSI device 6 (14 = 8 + 6).
;
; Logical DOS format.
;*DOS [Logical DOS] [Arguments], [Logical id]:[physical id],...
;
;The High Sierra driver won't be needed in most cases
;*DOS, C:\AUTO\cd_boot\HSMAY86.DOS, Q:Y
;
;The next line installs ISO9660F.DOS for MetaDOS drive letter Y
;(which has been assigned to SCSI 5 above) as GEMDOS drive R:. Note
;that a lot of applications can't access drive letters beyond P:, so
;you might have to change the drive letter.
```

Try to toggle "Use SCSIDRV routines" on "Advanced options for SCSI" on ExtenDOS 3.3. SPIN and ExtenDOS works fine here since years with differnet Toshiba CD-ROM and Yamaha Recorders. SPIN is read only!

Different is the hard disc driver. I used HDDriver and not CHBD. I kicked CHBD, AHDI and some other stuff with no support, if i changed from 520 st to falcon.

Hi Lonny,

>>AFAIK Keychange sells keyboards with Spanish keyboard caps but
>>conveniently forget to mention this.... :-/

>I see. I retract my previous statement then. Not such a great
>deal then, unless one wants that exact keyboard version.
TBH if it's for replacement purposes one could always remove the keycaps
and exchange them with the ones from the broken keyboard ofcourse. Not
mentioning this, isn't exactly "fair" trading. But "fair" trading is
something one shouldn't expect from Keychange to start with, the chance
of being swindled is quite high. Anyone wanting to do business with the
crook from up north should think twice....

Cheers from Belgium

>Will somebody in the US check out this German site and let us know the
>true cost of importing Atari gear from Germany to the US, inc shipping
>and taxes etc.
At the same time they can check out the keychange site, which as we all know contains all the relevant information concerning shipping, payment and guarantee. Keychange business policy ? ROTFL
Before critisizing a German dealer you better make sure that elemental information like this is present at what you call your "site"... Seidl Software Service has a package deal with UPS, whatever the size and/or weight of a package, the customer pays an overall price, up to 5Kgs it's $12 for the US and EEC countries. Shipment to other parts of the world cost $19. Seidl also provides the shipment ID number, the customer can alway track on Internet via the UPS site where exactly his package is. Credit Cards are charged when the package is actually shipped.

Perhaps you could inform us now how Keychange ships stuff to the US, how customers can pay you in a secure way and how they are covered in case something goes wrong with the shipment (ie. bits and pieces fallen out). Your insinuations about the taxes are bull, don't tell me that someone living in the US doesn't need to pay tax on a package coming from Britain while having to do so if it comes from Germany.

>Somebody call Rentokil....
Something bugging you? then you better call that sollicitor, before you know it that little itch will start hurting...

Hi Don,

>This would be a useful link if you took up directly to the Atari
>keyboards. Since my German in little to none. It took my a few minutes
>to find PC keyboards but NO Atari keyboards. Post a link that the
>keyboards can be found.
Sorry, it seems that the site has been changed, at the moment there's
little there that points to Atari. Seidl is one of the largest Atari
dealers in Germany and they have a big warehouse full of Atari gear.
Since a lot of Atari dealers can't make a living from only selling Atari
stuff, it's quite logical that their website point to PC stuff. That's
why I provided the emailaddress... they understand English.

It's not only Seidl which sells these keyboards, one can obtain them from
MUCS as well http://www.mucs.de (site is available in English). Since I
don't have a clue about the shipping price and payment conditions of MUCS
I recommended Seidl...

Cheers from Belgium

As above,

Mono printer, 24 pin with parallel interface (does work OK with
PowerPrint), a bit scruffy now, but works fine, and has manual.

I have no idea what this is worth, perhaps a tenner? No reasonable offer
refused!

I'm based in Luton, so a local collect/deliver would be preferable.

FamilyNet Newsgate

Hello!

LP> It is useful to have a traveler kit : with all the
> adaptator for electrical connector.:-)

This is just a personal preference, but power leads with the IEC plug on one (Atari) end and a US mains plug on the other should plug neatly into a step-up transformer (if required). I've found them easy to obtain, there's a good chance they would be less expensive than a traveller kit, and they will certainly be tidier.

LP> 3)If you have rf connector too.
> Ste and falcon.
> It is different , because the quartz for pal is not
> the same as the ntsc. So, "best electronic" buy a
> new quartz or simply use tv with ntsc+pal possibility.

You should get much better results with a monitor. If you're running high-res then a basic monochrome VGA monitor may do the job (with a suitable cable). If you're running colour modes then look for a monitor or TV with analog component video (RGB) inputs. Composite /may/ work though, and composite video inputs seem fairly common on US TVs. I don't know how many US TVs will support 50Hz though. YMMV.

I didn't bring any of my Atari computers with me from Britain, figuring that it would be easier (and possibly less expensive) for me to source a 110V NTSC compatible one over here than to try and convert one of mine.

Regards,
- Andy.

Hmm, it should work. Have you set all the Config.sys up to right ID and
drive letter? I use it on an IDE drive (even though it strictly says that
it won't work!).

I also have Czech and several other languages.

I will also take the PCB out and sell it as a spare part, try getting that
from other dealers.

The keycaps are discussed with the customer before ordering because EVERY
call is dealt with by me.

> TBH if it's for replacement purposes

Which it usually is....

> one could always remove the keycaps

I don't remember having to do this with the mod. I made. Once the monitor
jumpers were sorted out it was just straight connections to the ST.

Shipping is by carrier, I could use UPS if the customer wished.
Payment is by cheque, cash or bank draft, Western Union has been used.

No complaints so far, as you well know.

Again you are free to choose your supplier.

> Your insinuations about the taxes are bull,

Somebody point out my insinuations.
UK purchases from the US are subject to import duty and 17.5% VAT.
I have the docs to prove it.

> don't tell me that someone living in the US doesn't need to pay tax
>on a package coming from Britain while having to do so if it comes from
Germany.

Never did, can anybody find this statement in my posts.

> >Somebody call Rentokil....

Oh Dear.

Dennis (in my opinion) you really are a wanker of the highest order.

You haven't a clue what your on about but you continue to try and justify
your
lies by repeating them. Just admit that you have no experience of what you
are
saying.

You bang on about things that you know nothing about.
Where you there?
Of course not.
I think you should really be called Betty Eggleton.

Just to set the record straight. Keychange has been repairing / upgrading
and
supplying Atari parts for many years and has actively promoted the Atari
platform for music use. I will fully endorse the service aswell as the
prices charged.
BTW i can do this because as they say "I was there".

I suppose you are from the stable of that aother pillock Steve Sweet who
thinks
he is such a great important person. Upon checking with some of my customers
nobody really had a good word to say. I see that one of your other fellow
users
has ceased his allegations since the threat of legal action by TUS. I can
post
his rather pathetic retraction for all to see if you wish. BTW action will
still
be taken against the online magazine if any more rubbish is posted in the
same way.

You really don't have a clue. A bit like the VAT argument really.

Is there any way to do this from a Pentium/Windows machine? The only
Atari-flavour computer I have around here is the Mega STE.

Is HDDRUTIL an Atari utility, or from some other company?

Hi Dennis

>At the same time they can check out the keychange site,

You'd have to get the correct URL as i notice at least 2 sites that now
dont display a link to here since recently for some reason.

>which as we all know contains all the relevant information concerning
>shipping, payment and guarantee. Keychange business policy ? ROTFL

I asked that question a few days ago, posting details of your Buisness's
greivance policy may help clinch a few sales.

For instance, if a Keychange hard drive refused to work with my Link for
some reason, could i send it back for testing (Link + drive).

If my Veloce 020 failed, would my machine be repaired and returned, or
would it be exchanged for something technically inferior?.

FamilyNet Newsgate

Hello David!

DW> I use GULAM which is a bit old and have the following
> set on my gemulator system.

It's good to hear that it works under Gemulator. Under TOSbox I just got four bombs when trying to run gcc. I should probably try it under different emulators. STonX springs to mind as one that I should try.

I wonder how hard it would be to cobble together a cross-compiler, allowing me to do builds in native mode, and test the binaries under emulation. I imagine this would be a lot faster than running gcc under emulation.

DW> Drop me a mail

I'll do that, thanks.

5991. PC emulation - DOS running on STe

Newsgroup: comp.sys.atari.st
Date: 2001-05-13 17:45:06 UTC
From: music@kreed.com
Message-ID: <CKzL6.6$JK4.3894077478@news.onr.com>
Source record: 46524

Hello,

I was referred to this newsgroup from the Notator newsgroup.
I'm looking for software that will help me resolve a theory.
The software needs to run DOS on my Atari. There are
many emulators out there to run Atari on PC.. but not many
that run PC/DOS on an Atari. If you have this software
please let me know, and provide an *.ftp where I may
download this.

The reason for needing this is a theory I have.
I have an EMAX II which can upload and download
sample banks from PC using a program called EMX.
However I run Win 2000 and EMX needs to run
from DOS prompt. EMX also uses DS,DD floppy disks
only. My PC has an LS 120/HD floppy drive.

So my theory is if I can get my Atari to think like a
PC and run Dos everyonce in a while I will have access
to hundreds of sample banks designed specifically for my
EMAX.

I look forward to you feedback.

Yo Dave

All those of us ATARIANS (and indeed others) who still use ZETNET
as our main (and even only) ISP have much to thank them for.Usually
we have found they quickly respond to our rare complaints,the
latest not of their making but a BT fault. A visit to our own mail
group,zetnet-atarians,will back what I say.

Nice to see you still around Dave and still showing your interest
in ATARI.I know of course that you have passed on your
"commercial" interest.

ISTR there being a wiring diagram in a UK ST magazine - I think you may
have to link the horizontal and vertical sync's from the ST. Maybe it
depends on the exact model of ST or Cub monitor you have.

Why would BT have a unique implementation of PPP/PAP? You're dialing
into Zetnet's dial access platform therefore the PPP/PAP
implementation is all theirs!

From what I understand even Surftime which removes you from the
standard phone circuit onto a data platform still relies on the ISP to
support your data format.

Hi Dennis,

Straight information, no abuse :))

See:

http://www.users.zetnet.co.uk/goldie/

for Roy Golding's support site and

http://www.users.zetnet.co.uk/robertg/zetnet/

for Robert Goldsmith's support site.
```

As you know I am dabbling with UKFantastic, but have kept the faith with zetnet. They are not the fastest and certainly not the biggest, but, probably due to the competition from the 'free' ISP's, do react to any complaint, request, very very quickly. They got my web site set up by 'return post' and the updating is a doddle. Could be a case of 'better the devil you know than the one you don't' but at least I'm not forced to endure a 'home' ISP page festooned with adverts and biased news, sports posts.

See You,

Bob.

Perhaps a bit more basic:

50 Hz is generally used with European monitors
60 Hz is generally used with US monitors

Some programs, as noted mostly games and demos rely on going directly
to the hardware instead of using GEM to do the displays, so they will
display in whatever their "native" mode was.

That is, a European demo will try to display at 50 Hz, no matter what
kind of monitor you have connected. This can cause rolling and video
"tearing".

The STe video bit will allow you to change the output, but again, many
games and demos may bypass "patches" that attempt to set the video
mode manually, so it's not always successful.

>Chris :-(

There's recently been several discussions here in this newsgroup about how to replace the Atari floppy drive mechanism with a "modern" PC style floppy drive. Search the old messages for a thread titled "PC Floppys" for one discussion.

Another thing to consider, watch the listings on Ebay in their "Vintage Computers" areas. Occasionally you'll find someone getting rid of their Atari equipment for a song.

You might find someone selling an external SF-314 drive that you could take the mechanism out of, and depending on their location, the cost shouldn't be too bad.

The advantage of an Atari drive of course would be that it would be a "perfect fit" with no modifications needed. The disadvantage naturally would be that the drive would probably be just as old as the drive which has failed you.

Hi Bob!

I have found that when I am using my VideoTurtle(15.75KHz RGB to S-Video)
convertor, the 50Hz software is just shifted down, about 1/6 screen down.
On my 20" it's not bad, but on the 26" it's down about 1.5" from the top.
But no movement or nothing, great display and such. Just the RGB pixels are

much bigger than on a 1CM135 monitor! I am also able to see better the sorta "hidden" pics in demos, with the color values down low. Such as the Obnoxious Demo and the face in it. I have never had rolling, since I normally use a Falcon030 for the demos, and the ST/STe/MegaSTe only show the 1/6 screen "shift down".

Regards,

Jim W. Krych

Well, there WAS a software-only IBM emulator which ran on unmodified
STs and which would allow you to boot MS-DOS and run PC applications.

It was a commercial product called "PC-DITTO", and I have no idea what
the copyright status may be today, but I doubt it's available freely
for download.

If you could locate someone with the original PC-DITTO package for
sale, it might be worth a try.

The biggest problem was that the Atari ST is SO SLOW that software
emulation is exceptionally painful to watch. However, for your
application the speed might be acceptable.

(Later emulation efforts on the ST were hardware based, essentially
requiring you to install a circuit board with an 80286 based PC on it
inside the ST. The ST turned control over to the PC inside it and
became nothing more than a "dumb terminal" offering keyboard and
monitor support. These were very expensive and attained only marginal
success.)

Does the LS 120 not allow you to use DD floppy disks?

Wouldn't it be possible to boot your PC from an MS-DOS boot disk just
to run the EMX utility, then reboot into W2K?

>So my theory is if I can get my Atari to think like a
>PC and run Dos everyonce in a while I will have access

Another thought might be to see if a native Atari patch librarian
might be able to access the EMAX directly. I know absolutely nothing
about MIDI applications though, so maybe that's a bad idea.

I admit there _have_ been people posting stuff that uses a language I
wish I did not have to see "grown up" people use, that is a fact. That
goes from both this dealer guy and some that claims things about him.

Since I have had nothing at all to do with keychange, I am merely
saying that the keychange "public relations" are causing them more
harm than any of the accusations I have seen here.

You can't even find a 1.4meg drive with a ds0/ds1 switch anymore.
Kind of sad. Recently at a computer show in Dayton 2 or 2 tables were
selling alot of Epson SMD-340 that were pulled from old systems.
I was dam tempted to buy them all up as it is the one used in
the TT030. I didn't buy them and probably will regret it later.

Yup, seems like the old ignore list keeps on a growing.
I could care less about the finer points of VAT, taxes,
duty... and so on. Either the buyer wants it or they don't
want it that bad.

>In what way is Zetnet so dedicated to/for Atari? Do they have an Atari
>helpdesk or give setup scripts for Stik/STing, MinTNet, Iconnect etc... ?

As others have posted, they do indeed have set-up scripts available via
Robert Goldsmith's site. They also send new Atari users a floppy disk
with all the software needed to connect to Zetnet, and the
zetnet-atarians mailing list keeps us in touch with each other to try and
sort out any difficulties that may arise.

Some of their senior management staff regularly reply to concerns from
Atari users, and (perhaps most important of all right now) they have said
that they will keep their old dial-up numbers available which means that
Atari users who have difficulty with PPP connections can still connect
with Slip. At the same time, they also offer BT Surftime connections
for those of us able to connect via PPP/PAP. (For those not in the UK,
that is a way of paying a fixed amount per month to British Telecom in
order to have unlimited access to the internet.)

>I would say any ISP is just
>fine provided the quality of the connection, bandwidth, service and price
>is right...

I use other ISP's as well, but I stay with Zetnet because I like their
support for Ataris and, I believe, other platforms including Amiga.

They also seem to be an advertisement-free zone. The only e-mails they
send their customers contain relevant technical information, no "free"
offers, discount shopping etc. wrapped up in embedded HTML mails that my
PC mail programme can't even read. (I'm thinking of Freeserve at the
moment...)

All the best

Paul

Hi Joakim,
I for one do not blame Keychange for defending it's position.
This is
meant to be a free group but certain users think they own it. As far as i
know
the guy from Belgium and Sweet have never dealt with Keychange and
therefore have no grounds to make such remarks. Do you believe everything

your told or are you intelligent enough to look at both sides?
When remarks such as corporate Lawyers are made it really does make the
Guy from Belgium look a right wanker.

Ive got a Corporate Lawyer so i MUST be RIGHT. ROTFLMAO hehehehehehehehehe

Please post another one tomorrow, it really makes my day.

Dave.

Sure. When I had a brief look at the article on the project recently it
was clear right from the start that it would never be finished. Some
people are simply dreaming that the Atari market still has sufficient
potential for projects like this. But this is obviously wrong. There are
hardly any developers left, there is no money for such projects, and,
eventually, there are also not enough users left who would pay for the
software. That's the way it is. The XTOS project will go the same way.

Hi guys,
The Little BIG Competition 2001 is now over, and now we need the public to vote on the entries.

There are Seven Programs (currently 6, one programmer requires an extension until the 15th) and some BG images, icons sets, winframes.. Lots of fun stuff :)

Visit the LBC homepage to download the archive, which includes both English and German vote forms.

Take Care,
Bengy

>are just impossible to get hold of new :-(

Yes, you can use a PC style 1.44 Meg floppy disk drive, it just won't
take advantage of its High Density ability. It should work just fine
in Double Density.

There are a number of problems with using a PC style floppy disk
drive, none of which are insurmountable.

First, and least problematic is that standard PC floppy drives are now
1/3 height, while the Epson drives Atari used were 1/2 height. You'd
have to play with the mounting. Also, the faceplate on the Atari
drives is different, which means you have to modify the ST's case to
get the PC floppy to fit.

Secondly, the floppy drive cable in the Atari will probably have to be
turned over when it's plugged into the PC drive. The Atari Epson
floppy drives had Pin 1 furthest from the power connector, while
standard PC floppies have Pin 1 next to the power. Note the position
of the red stripe on the floppy cable before unplugging the old drive.

Third, the new floppy drive MUST have a jumper on it to allow it to be
set for DRIVE 0. All PC drives come set as Drive 1, thus you MUST
change the setting. Be aware that many PC floppy drives these days
don't have a means of changing the drive setting. Be sure to get a
replacement drive that has a jumper. Don't just assume it will.

Lastly, there is a problem with the way Atari implemented the Media
Change Line which informs the ST that the floppy disk has been
changed. The PC drive is somewhat different from the Atari Epson
floppy drive, so it may not properly update the directory information
when you take out a floppy disk and put in a different one.

The problem is that the ST maintains the disk directory in memory and
only re-reads a new directory when the disk is changed, or when
manually forced by either opening a new drive window or by pressing
ESC when the directory window is open.

With a PC floppy drive, the ST doesn't know the floppy disk has been
changed, so it doesn't read the new directory from the new disk. This
can be catastrophic if you write to the new disk because it will

overwrite the new directory with the old one still in memory, trashing the disk.

There is a way to fix this problem (if it exists with the drive you select to replace your dead ST drive, that is), but unfortunately I don't have the details as to how to do that.

A short-term workaround is to remember to press ESC every time you change the disk.

As I said, these problems can all be overcome, and you end up with a new floppy drive in your ST for around $15, easily available at any PC computer store.

Hi

I just bought a used Atari 1040ST. Before that, I have been using
the Pacifist emulator. I have a few games in MSA and ST images.
Question is: How do I transfer these imagess back onto a floppy to be
used on the genuine Atari ST?

If there is a software to do this, can you also tell me where to get
it.

Many thanks.

Andrew

Source record: 46414

You are correct, however:

If the machine is fast enough it is quite obvious that new software can be written MUCH more easily and especially be ported.
Example: java is IMPOSSIBLE as it is on atari because of speed mainly, mozilla, same thing, not even thinkable on standard atari, NOT because the code would not work (it would), just way too slow to be even usable.
Mame, same thing, mame would totally work, just way too slow.
The speed NOT only brings faster system (speed itself to run tos was never a real issue), but is really as of today as it would bring new application which were plainly impossible.
Half of the development on atari is wasted on routine to make it decently fast enough to make it barely usable.
Following the sparemint project very closely, software itself is not an issue (once again). Atari already has it's jewels (to its own respect), no need to recreate what's available already. (find a Papyrus equivalent for linux, or irix for example, they even seem to be content with a low quality software such as AbiWord). Atari has its pluses in some area, and could gain what the other platforms have, by just adding some reasonable speed. No new developers would come, it is not and will not be a platform viable commercially, but the users would have their lot of software and won't feel the lack as pretty much everything is/will be available.

FamilyNet Newsgate

Hello!

I don't have a lot of time to read newsgroups these days, and despite my long-standing interest in Atari machines and software, I'm ducking out of this group. One of the main reasons is that it's just got far too argumentative.

I couldn't go without thanking those people I've enjoyed chatting with here (you probably know who you are! :-) Special thanks to Uwe for his clear and interesting explanations of the Atari SCSI situation.

- Andy.

>As you know I am dabbling with UKFantastic, but have kept the faith
>with zetnet. They are not the fastest and certainly not the biggest,

The whole point is that Zetnet have gathered quite a few Atarians for their service, and it is these users who provide help for their fellows. Once these folk move on, the support will dwindle.

Zetnet do seem to have some odd requirements in the way of configurations to make their services work with Ataris, so this support seems vital.

>I'm not forced to endure a 'home' ISP page festooned with adverts and
>biased news, sports posts.

No-one is, not even IE users. It's all configurable in your browser to point to whatever page you like.

>Dennis (in my opinion) you really are a wanker of the highest order.
It takes one to know one, Dave :-)

>You haven't a clue what your on about but you continue to try and
>justify your lies by repeating them. Just admit that you have no
>experience of what you are saying.
On the contrary, the case is getting stronger all the time.

>I suppose you are from the stable of that aother pillock Steve Sweet
>who thinks he is such a great important person.
Suppose whatever you like, I will not loose any sleep over this. As for
Steve, yes he is a geat person, everyone who participates in this group
on a regular base IMO is a great person.

>Upon checking with some of my customers nobody really had a good word
>to say.
You really expect me to comment on this? sorry I will not step down to
that level...

>BTW action will still be taken against the online magazine if any more
>rubbish is posted in the same way.
Sorry mate.... wrong newsgroup, wrong thread if you ask me. Has anyone
here any idea what he's on about?
Just like your mate Barrie you seem to think we've got a crystal ball
here. What online magazine is posting rubbish? what's it all about?
Define "rubbish" please.

>I see that one of your other fellow users has ceased his allegations
>since the threat of legal action by TUS. I can post his rather pathetic
>retraction for all to see if you wish.
What on earth is TUS? The Ultimate Scam ?
And what exactly is ment by "one of my fellow users"? I don't have a
clue what you're on about.I don't wish anything, if you want to make
yourself ridiculous, go ahead and post the pathetic retraction, who
knows what might fall out of the cupboard....

>Just to set the record straight. Keychange has been repairing /
>upgrading and supplying Atari parts for many years and has actively
>promoted the Atari platform for music use.
You don't have to put anything straight, just go and lick Barrie's arse
somewhere else. At this very moment I have *documented proof* of four
people that have been swindled by Keychange..... threads like this are
really usefull, I'm pretty sure that "victim No. 5" will come forward

soon.... one can only wonder how long the list really is :-/

I've given Barrie all the rope he needed to take legal actions against me, how much rope does one need? I publicly accused him several times of being a common thief, swindler & crook. His pathetic reaction was that he's going to sue me, when? in donkey years?
Any normal person being publicly slandered like this, provided that the allegations aren't true ofcourse, would *run* to his sollicitor and seek justice.

>I will fully endorse the service aswell as the prices charged.
That's entirely up to you ofcourse, but how does one justify endorsing a business that on several occasions swindled his customers?

>You really don't have a clue. A bit like the VAT argument really.
There's nothing to argue about....
Suppose someone living in a non-EEC country buys goods which costs 100 Pounds, from a "proper" dealer he can deduct the VAT (17.5%), this amount is enough to cover the shipment costs. From a non registered VAT dealer that person can't deduct anything, which means that the goods would cost him 17.5% more.
What's so difficult to grasp about this?

Cheers from Belgium
Dennis

>Hi Joakim,
>I for one do not blame Keychange for defending it's position.

From what I can see, he is only hurting himself through what he has been posted recently. It is expected that anyone getting accused of something would like to defend himself, but this won't do him any good.

>This is
>meant to be a free group but certain users think they own it.

I have followed the related threads for quite a while and have noticed that it goes both ways. That said, I don't support that regardless of who is doing it. While this is a free group some may argue that it is not the best place for commercial advertising. But that is another story.

>As far as i know
>the guy from Belgium and Sweet have never dealt with Keychange and
>therefore have no grounds to make such remarks. Do you believe everything
>your told or are you intelligent enough to look at both sides?

For all I know they have not been doing business with keychange themselves, but say they have been in touch with ppl that did. I can't say if that is true or false.

I have never said I agree with things said by either of those, I have rather commented that the language used in threads from both sides have crossed the line for what is constructive. However, anyone running a business is out on deep water when insulting others in public. If I only had read the last postings here I might perhaps have agreed with you, but I have followed this story for quite some time now. He is the one loosing on all these pies being thrown. I can only speak for myself when I say I would think twice before doing business with a firm that represents itself like this in a public forum. The threats about legal actions has been going on for a while now, giving this story a really bad taste..

I have no doubts I am intelligent enough to look at both sides so that should not be a problem. Obviously there have been problems between Keychange and some former customers. Not trying to judge anyone here, but I doubt ppl would just pick out a dealer and pick on him for fun. Something must have been going very wrong in the communication between

the firm and the customers at some points since there are a lot of
hard feeling here.

While the old saying "the customer is always right" might not apply to
every situation or detail, it certainly has a lot of truth to it.
Something that seems to have been completely overlooked here.
I just wish that all parts could come to an agreement so we did not have
to see any more pies thrown here. It is fairly wellknown that from a
dealers point of view you need to get about 3 new customers for
everyone you loose to keep things going. So there is no doubt that
good relations with customers will pay off.

>Please post another one tomorrow, it really makes my day.

Why do you feel the need to imply that my postings are nothing but jokes?
If you feel you need to provoce me I can't stop you, but I will stay out of that.
Weren't you the one that said that one should look at both sides?
Let's at least try.

/Joakim

another snip.

Very few Ataris had half height drives. Mostley earl STFMs and STFs, also early external Atari drives too. These were comonly single sided too. I have had 8 Sts and NONE had half height drives. So I would check too see if it has the big button and if it does then worry.

Hello.

I have a modified STFM in a Lighthouse case for sale.

The FM is Tos 1.4, has 4mb ram and has Overscan,

Hi dense floppy drive and the modem port mod.

The 68000 is in a socket, there maybe a 16mhz accelerator

available once I have checked it.

A large PSU is fitted in the upper half of the case.

An 8 watt amp and loudspeaker is fitted.

The external kbrd is included as well as one of my new Mega STE kbrds.

It is working but is sold as seen. Some tidying up is needed.

New retail would have been around £300.

Sensible offers please.

Barrie at Keychange. barrie@keychange.co.uk

I also use SoftPC and on my Hades it is very fast. It is made for Atari computers with a 030 CPU or better. It is probably the best PC emulator for the Atari computers (PC Speed for the Falcon may be better). I have gotten the printer options to work, but have not been able to get the serial ports to work fully. It runs most DOS programs just great. It is free off of the NET. Find it at:

http://www.crosswinds.net/~thothy/atari/misc/softpc_e.html
Any questions as to it's installation. Just email me.

Message-ID: <y2SL6.4173$l6.590571@monolith.news.easynet.net>
Source record: 46472

Folks,

further to my posting of a couple of month ago I had decided it is time to let my TT go spec as follows:

Atari TT 32MHz 68030
16Mb TT Ram
4 Mb ST Ram
1Gb Hard Disk
1.44Mb Floppy Drive (Original)
Atari 19" Black & White monitor
TOS 3.06
New keyboard Mechanism (Spanish unfortunately) & old mechanism with UK keycaps
Good Atari Mouse.

The machine is clean and tidy and reliable, I will throw in a Biodata VME ethernet card though I have no idea if it works as yet I have failed to find any drivers for it.

The only issue with the machine is that the screen jumps at the top left when initially started up, I understand that it is to do with the graphics controller, once the machine is warm it works perfectly. There is no obvious burn in on the display and it is a great box.

I will clean up the hard drive I use NVDI 5 and HD Driver 8 so you will need licenced copies of these should you continue using these.

I am based in Stockport south of Manchester, I can ship it if you need me to you will pay the carriage.

I am looking for offers in excess of £200 (£201 will not secure it for you!)
and you are most welcome to come and see it before you decide.

For those who know TT,s It is one of the later models that only has one case fan.

Drop me a line if you are interested.

Regards

Julian

> PS2 PSU. But which wires go where? Has any body done this?
> Thanks, Mark

Yes, I recently did this when my Falcon PSU blew. I use an AT power supply. It's pretty simple, actually. First, de-solder or clip the Falcon's power connector from its power supply, and clip the leads from the AT power supply cable. Solder the red and black leads on the Falcon connector to the red and black leads on the AT unit. The next part is crucial!!! I made a mistake with this one, and ended up blowing a transistor on the motherboard! The colors of the 12v line are different on the Atari and PC power supplies. DO NOT CONNECT BLUE TO BLUE! Connect the blue wire on the Falcon connector to the yellow wire from the AT supply cable. The blue wire on the AT supply cable has the opposite polarity as the Falcon's. Once all the Falcon's connector wires are soldered on, plug it all in, switch it on, and all should work fine!

You should be aware that you will need to re-case the Falcon unless you want the power supply dangling off the back end. Desktoppers and C-Lab MK-X cases aren't even big enough. You'd need to get a PC case and do some hacking. It took some doing, but I (with the help of a couple other Atarians here in town) got my Falcon into a very nice looking mid-tower case. I like it a lot better than the other various case designs I've had, as it's got way more than enough room than I'll ever need, and it's much easier to get into for upgrading, as it's a "screwless" case. It basically just pops open with a firm tug.

Source record: 46476

Depending on the vintage of your machine, it could be that you are simply
a victim of "chip creep".

Try this:

Unplug everything from your ST and remove any floppy disk you may have
in the drive.

Raise one end of the ST approx. 6-8 inches from the table and let it drop.

Do the same with the other end. (Repeat if you want)

OR

Take apart your ST and push the chips back into their sockets.

This works 99% of the time unless your floppy drive is FUBAR. It's worth
a try before you get too far into the woods.

Fidonet, as normal? Closer to home is atari 8b it.. not sure there
is any fido for it? My system is essentially a real ST, emulated, to run
old ST bbs stuff in perpetuity. The fido stuff is all unix driven but I
use it to write out MSG format echo bases, which all the ST stuff can
read.

Never heard of Cabell and JYBOLAC's?

There are several options, but essentially to know how to use them
you need to remember your fido stuff.. fido is pretty heavily voodoo'd in
this day and age.

For *unix* (you linux kids forget your'e part of a bigger
family!) you can use Husky among others. Husky is still being developed,
and OSS. I've found it quite workable!

> only work on a Falcon or TT?

First please note that HDDRUTIL is commercial software.

Running it from the STE won't help anyway, because without the correct
setting it is simply impossible for any software to detect the drive.
You MUST connect your drive to another machine in order to change the
parity setting by software. Or you must connect (at least temporarily)
your drive to an ST/STE with a host adapter that supports parity.

Hi!
Adaptatator is very cheap, about 20 pound.
It is useful for europe and word traveler;
you can find this everywhere:-)
But, it is only connector but not tranformer , of course!
>

The problem isn't RGB or vga here.
With atari ste and falcon we have tv pal or ntsc antenna picture;(rf)
Coaxial 50 ohm , just like tv ....
It is very useful in hotel, for exemple, to connect or prepare prog....
Of course, with tape recorder, secam&pal&ntsc , no problem
to take screen picture directly on vidï¿½o.
Of course it is only basic possibility.
With million you can do what you want.:-)

Hi there is no price on there site and the last I saw it was at 279 ukp in
1996. Maybe they have some old units, that price is too high for me.

Maybe you should try copying the ones you want into your own RSC using
Inteface, WERCs etc. I've yet to try the icons (look nice though from the
pics) but doesn't that screen backdrop look nice! Won't mention which one
as it'll be biasing. I'll be giving it a go soon though

OK:
ParadiseBrowser put on ice
It would have been too good after all: The Office package
inclusive of the new web browser ParadiseBrowser has been put on
ice for the time being. According to the developers' web site,
important programmers have left the project. Users report that
Paradise are selling their Atari hardware on the American eBay
site due to changing systems/platforms.
We have not yet received an explanation of these events from
Paradise Webdesign.

>How big of a step up transformer would I need for an STe or Mega STe?

Most Mega STes came with a 'universal' switch-mode power supply, but if yours is not one of these then somewhere round 50 to 100 VA should do. Can be an auto rather than a double-winding (isolating) transformer. As I said earlier on this topic to another query, it might be possible to use an old power-line transformer from a tube TV or radio that has a 115 and 220 (or 240) V taps on its primary as an auto for this. They were very common in Europe, but I guess only on 'International' radio sets over your side of the pond. We generally had to use a 'line-cord' or other resistive dropper to use US radios here. (These were usually designed for AC/DC power, with the tube heaters in series all drawing the same current - 0.3 A as a rule - and often higher than normal heater voltage so that it would add up to 115V (with any excess dropped by a small resistor if necessary) and the HT rectifier connected straight to the power supply. OK with 110V, a little risky with 220/240V as often the chassis would be live :-(Quite shocking, really!)

>jumpers were sorted out it was just straight connections to the ST.

I think the resistors are there mainly to provide isolation and
prevent a dead short between the H and V syncs output. It might
work OK without them but could place an exessive load on the
driver or generator chip(s) or in some cases cause interference
between V and H sync and even pull them off the desired frequency.

>
>I've got a soldering iron like that, you heat it up in a gas flame ;-)

Actually I bought a new 'location' soldering iron some 10 years
ago that was powered by a butane refill. Quite small tip and
heat capacity. Useful if a lead went down when on location in the
wilds and you couldn't connect your 12 V soldering iron to the car
battery.

>Hope that that flux isn't acidic...

No, it is special flux made for electrical work - not too
different from the rosin-core on modern solder and acid free.

SNIP

>Yes. You can use one of those hotair guns that are used for paint stripping,
>but the big problem is preventing surrounding components from coming loose
>when you tap the PCB to shake off the target component.

In one device ISTR seeing you had a shroud to localise the hot
air - could use it for the endless spouting in the current
election climate :-)

Ah! So the message got through, maybe twice? My ISP(UPC) is constantly making a mess
of its expensive services. :-(

> Is it stable to use constantly as main AES?
>

That is up to you, and all of you out there ;-)
If you are willing to use it for a few hours every now and then and report to me,
it will become stable. Needless to say that you use it only on non vital work.

It is very difficult for me to make assumptions, because the original is not
written by me. I keep fixing bugs and crashes.

The only thing I can say is that I really want to get it stable and that one day
it will be at least as stable as any other AES for MiNT ;-)

> would cost him 17.5% more.
> What's so difficult to grasp about this?
Ah. A change of story. You don't need to suck up to the group (Licking a few
arses is probably more your style). This is not what you implied in a
previous
thread and you damn well know it.

As i have stated before, please tell the group if you have first hand
knowledge
of what you are on about OR are you just a thick, bored wanker who dosen't
have a clue.

P.S. Do you want me to email you a few arse licking web sites. I'm sure
Steve could
provide a few URL's

I have a knackered STE that needs fixing,

I live in the UK

Where can i get it fixed?

Dave

6096. Trade Ultima III boxed complete for Moebius boxed complete (ST)

Newsgroup: comp.sys.atari.st
Date: 2001-05-15 00:59:11 UTC
From: Satcom2 <svenhard@primenet.com>
Message-ID: <9dq00uqfu2@nnrp1.phx.gblx.net>
Source record: 46424
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Would anyone out there like to trade Ultima III (Atari ST) for Moebius (Atari ST)? I used to have Moebius a long time ago and lost it, and I have Ultima 3 on my Atari 800xl already so I can part with it on my ST. E-mail me if you want to trade. They are both worth about the same and both pretty hard to find. Thanks. -Satcom2

6097. FS: Quantum LPS340S scsi hard drive

Newsgroup: comp.sys.atari.st
Date: 2001-05-15 02:38:47 UTC
From: SomeGuy@SomewhereOnTheInternet.com
Message-ID: <NI0M6.357$qa5.5158@read1>
Source record: 46425

It came out of my Atari Mega 4 STE, where it was working fine. Will work in another Mega STE.

Make me an offer.

Thanks,
Richard Whitehouse

6098. Atari Computers, software, and hardware on Ebay

Newsgroup: comp.sys.atari.st
Date: 2001-05-15 05:24:05 UTC
From: Don <dons@qnet.com>
Message-ID: <3B00BD75.916AFDCB@qnet.com>
Source record: 46426

I have a bunch of Atari items listed on Ebay. Items include:

Atari Falcon
Atari 1040 STE w/IDE interface and 540meg Hard drive
SC1224
SM124
ICD Link 2
ICD Advantage SCSI Host adapter

and more. With more to be listed daily. If you want need something or
looking for something special email me with what you want I may have it.

Don

Not moving away from the Atari just selling some off.

6099. New: Icon EXTRACT for ATARI Computer

Newsgroup: comp.sys.atari.st
Date: 2001-05-15 06:18:31 UTC
From: lafabrie florent <lafabrie@club-internet.fr>
Message-ID: <3B00CA37.35C73F30@club-internet.fr>
Source record: 46427

Hello,
(excuse me for my English)

I have just created a new program (Icon EXTRACT) for ATARI in downloading on my site: http://www.club-internet.fr/perso/lafabrie/ and on the site of Magic On Line (for the Little Big Competition) : http://www.magical-side.de/lbc/

If the program pleases you, think to vote for me. It is counseled to read all the documentation on the ST-Guide file or on my Internet site because the program permits a lot of regulating.

The installation of the program is make with GEMSetup 2.01

1 - Principle of the program :

Icon Extract extracts all icons of the ICO, CUR, ANI, ICL and DLL files of Windows in 2, 16 and 256 colors and save them in the RSC files created automatically (by group of 90 CICON structures to the maximum). At present icons in 24 bits are not supported. Sizes can be in 16x16, 32x32, 48x48, 64x64 and 72x72 pixels. At the time of the treatment, a resource file is created for every selected size. In the case of icons in 256 colors, there is the possibility to choose between the palette 8 bits of NVDI, of the Falcon 030 or the one under utilization for the recalcul of the CICON structures in 256 colors. Indeed under Windows, the notion of color palette doesn't exist, alone the first 16 colors must be respected to display the graphic interfacing. Of the numerous necessary calculations fact, it is counseled to have a recent computer and is equipped of an arithmetic coprocessor (68881/2). With regard to the library ICL files, DLL (solely with type NE) and ANI (cursor animated) files, there is first of all before treatment, an extraction of icons to the ICO format or CUR and creation of an index to save them.

The program permits by choice of scanner all one index or only a file.

The program was developed on a Falcon 030 (68030-68882) 14 Mo - TOS 4.02

+ CT2 rev B (32 Mo of TT Ram) with PURE C 1.1 and Interface 2.33. It uses functions Mydial 2.19 and the XRSRC routines (for files extended RSC). It's important to see the RSC files created. Many Userdefs objects

have been created as for example for funds of screen and windows of dialogue, rod of progression and button.

Four versions are available :
- 68030
- 68030 + 68881/2

- 68000
- 68000 + 68881/2

This program has been tested on Falcon 030 (68030-68882) + CT2 rev B, PC

Pentium III 866 Mhz (with Magic PC) and a IMac Power PC 333 Mhz (with Magic Mac PC). It's work with Magic ATARI, NAES and TOS only.

All functions of the program are available. In the case of a version no recorded, a dialog box appears during 10 seconds at the time of the opening and the closing of the program.

2 - The program supports the following elements :

- Support of Bubble GEM (in French, Spanish and English).
- Help in line to the format ST-Guide (in French, Spanish and English).
- Help in line to the HTML format (French solely) in my web page.
- RSC file in French, Spanish and English.
- Documentation (11 Mo) to the format CDK Calamus SL 2000 for the registred version (French solely).

3 - Resolution and computer counseled :

The program functions in all graphic fashions from a resolution of 640 x

480. Nevertheless it is counseled to use him in 256 colors. In one fashion superior there is a small problem of first 256 color respect again for the calculation of the CICON structures 8 bits.
It is preferable to have a fast computer (TT, Falcon or better...) with an arithmetic coprocessor and 8 Mo of RAM.

Future supports :
- OCX files, EXE (Windows) and XPM (Linux).
- In head of files Windows to the PE format.
- Icons in 24 bits.

4 - Internet site:
A list of about 20 sites to download icons to the ICO format, CUR, ANI and ICL is available on my site in the category of Extract Icon and on the help in line to the format ST-Guide.

5 - To contact me and download the program :
http://www.club-internet.fr/perso/lafabrie/
E-mail: lafabrie@club-internet.fr

I hope that my contribution to our world will bring a puff of oxygen (come directly of the Pyrenees) in this spring a few belated.
Best regard,
Florent LAFABRIE
lafabrie@club-internet.fr

Hi Kevin!

Nice to see you are back! Hope your exams have gone well!

>The Little BIG Competition 2001 is now over, and now we need the public to
>vote on the entries.
>
>There are Seven Programs (currently 6, one programmer requires an extension
>until the 15th) and some BG images, icons sets, winframes.. Lots of fun
>stuff :)

Two problems though:

1) the documentation to Gem-Elite by Christian Putzig says it has a
minimum resolution of 800x600, but even when I run the program under
800x608 res (with Videlity on my Falcon) the program complains and
refuses to run. The strange thing is that in the dialog box it says it
can use 512x540 res minimum.

2) Gaston looks really interesting but as it's in German I don't know what
it's supposed to be. Can someone give me a quick rundown of what it is?

Cheers!

James

>
>Raise one end of the ST approx. 6-8 inches from the table and let it drop.

NOOOoooooooooo!
Why do people presist with this "drop test" myth, concussive maintance is
not the answer.
IC's don't usually unseat themselves from the sockets and where they do the
only solution is take the top off and manually push them back in.
Although to the uninitiated drop testing may appear to temporaily fix Dry
Joints or loose connector problem it is neither a good or permanant solution
and is more likly to cause more of them in the long term.

On the up side it can be a vary good way of misaligning you drive heads!.

Yes, this is a (now) known bug. There is a fix available, which will be made
available ASAP (along with two late submissions: another entry into the
Little Helper section and another New Look archive). I will put the Elite
Patch online today, and the other two entries should be up soon along with
an updated vote form... (Today, hopefully...)

Take Care,
Bengy

Guess not. Even Luna seems to have come to a stop, with the latest version
only available from a beta-tester's area. Isn't it time that it was brought
out into the light of day?

You might have been better to have started a new thread with this question
:-(

Anyway, try and pin down whether it's the scanner or CDROM that is causing
this error message. It might be that you've somehow messed up HDDRiver's
config so that it thinks that the C: drive is one of those two devices. I
usually keep the "Keep partition assignment" button ticked...

I've read about some sort of heat-proof sellotape in the line of component protection, I guess that you just plaster the stuff about the area leaving the part to be removed uncovered.

Still sounds risky to me, I'd rather leave a job like this to the professionals, who can put right any problems arising.

A less 'theoretical' answer:

I routinely edit and compile XaAES under itself now.
I have it up on my Milan for whole days.

The point is that I do not have ALL Atari programs.
That is where the beta testing comes in.

I think it is pretty stable at the moment.
More and more programs start working.

I fix everything that comes to my attention.
The easy things as soon as possible, difficult things may take a little longer.
Crashes always come first.

I was just browsing through amiga.org and there was a discussion on whether or not there was a mascot for the Amoeba. They came up with some Amy (a squirrell). Did Atari ever have a mascot? Like Penguin for Linux, Mario for Nintendo, Sonic for Sega etc... There's always the good old Fuji but i don't think that it counts as a mascot. If there never was a mascot, would it be a good idea to create one?

Joshua.

Hi Henk,

very good work! XaAES is getting quite close to become fully functional
for all purposes.

I notice some "delay" in the mouse happenings at times, and a few
applications look slightly wrong (the Aniplayer setup boxes for example).

I made a snapshot of the new XaAES running: http://ae.dhs.nu/xaaes.gif

Thanks for your help :-)

I didn't do the drop test but I did take my ST apart to look for any
loose chips/connections. Nothing seems to be wrong.

>NOOOooooooooooo!

>and is more likly to cause more of them in the long term.
>
>On the up side it can be a vary good way of misaligning you drive heads!.

to be honest I think thats the problem with my drive. I took the drive
apart to try to find an obvious problem and there was a large hair
stuck between the heads. I carefully removed it and it hasn't solved
the problem. The drive just clicks and whirrs without actually reading
any data from the disk.

Is there a way of checking to see if the heads are misaligned? if so
is there a way of correcting it without the use of any special
equipment?

Thanks,

Chris.

I don't know how BIG the big button is supposed to be on these old
STFMs but the one in my system is about the same size as any ordinary
floppy drive (about half an inch wide). Is that a good sign?

The idea of using a PC floppy drive does sound promising but a friend
of mine who also collects STs says there may be a problem with the
stepping on a non-ST drive. Any ideas?

The drive in my ST is has a sony label on the top of it? and its the
original drive that came with my ST. I also have a second external
drive which also has the sony label visable through the cooling vents
on the top. If I cannot find a replacement drive would it be possible
to remove the second drive from its caseing and fit it in the ST as an
internal drive?

Thanks again its much appreciated,

Chris.

I think GEMULATOR is probably the best for development. It can use native
Windows Disk, and is
very quick on my laptop (it is an 800 Mhz PIII though). Much quicker than a
real STE and is reasonably compatible with a real ST. It did take me a bit
of fiddleing with settings to get it working, but now its running it seems
about as solid as my STE (I don't suppose that is saying much).

Its also free, which again is a great advantage.

> I wonder how hard it would be to cobble together a cross

The problem with this is that you need to get the files across and many on
the emulators don't support acess to native disk, and the tools for moving
files to/from the emulated disk images are all a bit primitive.

I am against emulators etc but at work I have to use a computer on a network. It doesn't matter if it's a PC, MAC or a Linux or even an Atari system as long as it can hook up to the Network using DHCP. That rules out my Falcon which I don't want to bring to work anyway. There's a Power Mac sitting around here that I used for awhile. It's running 180MHz PPC603e which kinda slow for OS9. If I installed MagicMac on it, would I be able to use it on the Network and browse the internet using CAB? Dial-up is not an option. Thanks.

Joshua.

>has the big button and if it does then worry.

My fairly early STFM had a single-sided Chinon drive which I think
was half-height. It also had a small adaptor PCB between the
Shugart bus and drive. I changed it for a standard PC type with
no problems. The mounting holes were the same and the disk slot
lined up reasonably well, though I had to cut the facia plate a
bit. Can't remember whether I needed extra spacers or not. Later I
changed it for an HD drive - at first used for DD disks only, but
later had the clock conversion fitted so it could use HDs too.

The possible problems with not detecting disk changes can be
solved to a large extent by using FMC.PRG (=Force Media Change) in
the AUTO folder, though to be on the safe side it is worth
pressing Esc if a disk is changed and you are on the desktop, as
described earlier. But this won't work if you are in a program,
change disks and want to save your work. In that case it's worth
while saving to B:\. You will be asked to insert disk B into drive
A, but if you have already done so just press Return or click OK.

Regards, /Peter/

Yes, that is correct. At least I would do it that way. Just run the
file PPP_DATEI.RSC through a resource editor and make the changes, then
load it into Jinnee.

I have almost the same type of problem. When I use an external drive on
my STe, the internal drive will not format or write to the inserted
disk properly. I am not sure what the problem is, but it could be the
controller or else a bug in the TOS.

Sounds like the external drive has gone. The WD chip works for both
drives, so if it didn't work for one it wouldn't work for the other. The
external is pulling some lines low/high and not letting drive A in.

Where do you live?

Source record: 46375

Many people requested that the LBC archive be split up into smaller sections, as a 9MB archive is too big for many users with dial-up access. This has been done, and now individuals can download each mini-contest in its own archive. As well, a new "New Look" entry has been added, which means that there is no longer a monopoly in the BG images competition! The New Look, Gemma, contains new winframes, BG images, and "Start" button. Make sure to grab the Gemma archive as well as the updated vote forms. Finally, many may have noticed that Elite did not run in 800x600 resolutions, this is no longer a problem with the available bugfix.

GEMMA archive:
http://magical-sides.de/lbc/download/GEMMA.ZIP (280KB)

Elite Bug Fix:
http://magical-sides.de/lbc/download/ELITE_BF.LZH (200KB)

Updated Vote Forms:
http://magical-sides.de/lbc/download/vote.LZH (4.5KB)

Individuals downloads found at:
http://www.magical-sides.de/lbc/

Take Care,
Bengy

Hi Dave, take a seat.

>Mr Sweet would you like to explain your statement.

I didnt make a statement, i asked a hypothetical question.

>> If my Veloce 020 failed, would my machine be repaired and returned,
>>or would it be exchanged for something technically inferior?.

>Either explain your reason for the above comment by email to
>maccdave@btinternet.com where the matter may be discussed or i will
>take the matter further.

I didnt make a comment, i asked a question, it was quite simple.

>A retraction to the group will also be required.

For what, asking a question.

>>You may wish to contact Shiuming Lai before typing.

I dont see what Shiuming has to do with this, i dont see why he should
be dragged into this.

>>Just for the groups information i designed and sold all the Veloce
>>upgrades

And a very welcome addition they were to the Atari 'hobby fraternity', i
congratulate you for your inovation and your technical skill. In fact i
seriously considered a purchase before i got the MegaSTE.
And based on what ive heard folks who have owned one say about it, i
would have no hesitation in recomending the device to any potential
purchaser.

>>And to my knowledge none have failed.

And none to my knowledge either, but as you know, its possible for this
to occur, and equally possible for the host machine and its devices to
cause problems as well.

Hi Lyndon.

The question should be. What are you lot playing at.

Firstly, I would like to appologise to the group for my abusive language.
However, this is not extended to the the intended recipients. I have
read the groups for many years and i find it difficult to believe that
a couple of regular contributors can hold a Kangaroo court whilst
others just stand by and watch.

As you are probably aware Barrie used to help out on my stand at
the shows and is competent at repairing ST's. I have passed on many
of my former customers to him over the past year as i now develop
parts for the PC and don't have the time. You people know how much
effort i put into TUS - would i really put my trust in Barrie if i thought
he was going to swindle them.

Running a small business is bloody hard work even when things are
going well never mind when the market slows down. The customer
from hell always comes along at the wrong time and some are hell
bent on causing as much trouble as possible if they don't get their way.
I will be the first to admit that not every job went well and i took
some pretty drastic action with some of them. If any are reading this
then feel free to air your complaint.

Sean's hard drive.
Believe me, Sean has been very conservative with the truth on this
one. I have stated previously "i know because i was there". I really
should not elaborate any further because of the pending legal action
but i will say that i checked it twice - DOES MR SWEET WISH
TO QUESTION MY TECHNICAL ABILITY.

Alleged Replacement of Superior Parts.
ie Veloced STE with a Mega
Once again not too much can be said in public. What i would advise

anyone who wishes to know should contact Mr Lai who would
appear to have spread the story and has since tried to retract it.

This group is being destroyed by two people who think they
are peoples champions. I don't know what mission they are
on but it is up to the group to get it's house in order.

Any spelling mistakes are not deliberate. Grade 5 CSE you see.

Ah well, we can't all be perfect can we Dennis and Steve.

Dave

BTW Should i start spreading stories about the MOST reputable of
UK based Atari dealers into the group. I can certainly tell a few,
i know because i fixed them after they stuffed up.

ie. Faulty power supply (2nd hand sold as new re: Mr Adez) they
couldn't even be bothered to check it before putting it in.
Replacement STE disc drives that don't detec disc change,
HI Mike remember that one that stuffed your discs.

Should i elaborate? Off course not.

>assigned.'

>Does it mean that I have to edit the RSC file?

Yes it does although its easy enough to do. you must ensure 'each' icon
in a given faulty .RSC file has a unique label.

A lot of RSC files around, either have no names assigned to individual
icons or are all called something imaginative like "colour_icon".

No, there should be no problem with a PC drive used as a replacement
for a normal ST drive in an unmodified ST..

If you were to go a step farther and hack the system to change the
clock rate to the floppy controller chip in order to use the drive as
a High Density drive, THEN you would have to worry about the step
rate.

>
>The drive in my ST is has a sony label on the top of it? and its the

Yes, that would work fine, and would be an easy "drop in" replacement.

This is why I suggested watching eBay for someone selling an external
floppy drive. You could easily swap the drive mechanism with no
modifications at all.

hi all,
i would not write off this platform entirely, what is really needed is dedicated people to do this with the understanding that this is a nitch market with a small return, but a return that will be a dribble for many years to come, not a get rich quick scheme.
some of the people involved in projects like this want riches, i myself have run into many like that in my small endeavors on the game machines, and the 8-bit, but the ones who understand stick with it for small returns, and the pleasure of doing what they are told is not practical.
everything that we do here at video 61 is done to prove to certain ex-atari people that it can be done, and it could have been done years ago with ease, and profitability. some do watch these groups.
also work done on these platforms can be carried over to help you in other projects that are more profitable on other platforms if you decide to move on, but to give up before the product is done if its doable just short changes everyone including yourself,
thanks,
lance

Good evening,

Ok, here is the deal.

I have:

Strong knowledge of Unix, MiNT, Sparemint, GEM, TOS, a cdrom burner and fast internet access.

Here is what I would like to see:

A cdrom MiNT installation (100% self sufficient), probably to be sold to you guys for a minimum fee. (at least to cover my ass).

Would it be worth it? (especially my time).

I can have a fully functional sparemint install for myself, I am thinking that it is a shame that only 5% of atari users are able to use this kind of setup, probably because they were the only ones to have anything > than a 520STF, or they just got lucky during the install. Anyway, I would like to see more people enjoying an advanced configuration.

I would like to see a few things in order to make this possible:
1) bootup floppy (containing a cdrom driver (SPIN? Julian Reschke?), an XHDI hd driver (cbhd? hddriver?) and minimum tools to start the installation from the cdrom then.
2) some tech doc writers (2 for english, 1 for french, 1 for german and the more the merrier)
3) some consensus, agreement, e-meetings (irc, email whatever) to keep a strong focus on the project.
4) depending on the price of the cd (to be decided), the real authors (such as F. Naumann, Thomas Binder, Draco etc etc) would be rewarded with money. NOTE: the distribution would be available for free on the web as an ISO image, so if you have time OR fast internet access, it would be 100% free. (reminder, I do NOT do that for the money, i already have a job that pays really well).
5) some artists (graphics, music, etc) and different developers to help in this project are welcome.

6) some betatesters would be needed as well. (MiNT newbies prefered, or magic fanatics would even be better).

This is a BIG project, i totally realize that, big in effort, not in time as we practically have all the pieces of this puzzle, it is just a matter of gathering all that neatly and logically.

Anyway, feel free to post your comments in this very newsgroup. It could be a very interesting project.

Thanks for your time.

Unless someone knows otherwise the Explorer Disk is the closest thing to
this for the Atari, I can provide you with a copy if you want one.

Hiya

What do you mean by boot disk?

Are the ST's you have the original machines that doesn't has TOS on ROM?

or do you get the familiar green desktop and you need the language disk
that contains the control panel etc?

> Joshua.

Atari has had MANY mascots. Off the top of my head I can think of Pac-Man
and the cartoonish Jaguar for the Jaguar 64 bit system.

For the ST line, a falcon would be a good choice. A few year ago there was
a few cartoons of a Milan (bird) when the Milan Atari clone came out.

Just FYI.

I don't have a clue, I think that the shopkeeper should be able to inform
you about both these hypothetic cases. If he can spare the time that is,
the last six weeks he's been very busy preparing a file for libellous
action, it might be inconvenient....

Cheers from Belgium

I see, well then this really is an ISP to cherish.

I can remember when I set my first steps on the Internet.... if only a
service like this would have been at hand at my local ISP, it would have
solved many problems...
It took over a week before the technical department realised that because
of their CHAP connection it was impossible for me to connect. When I told
them that I used an Atari.... they bursted out in laughing :-(
The good news is that they are out of business now, and I'm still here with
my Atari :-)

Cheers from Belgium

> two? Thanks.

Yup, done just that. This does get trick tho. You can fit the adaptor tinto a small box the size of a pack of fags (not poofs). All I have done is to wire hsync to but plugs as well as vsync and gnd. Then get a 4 way dpdt switch and seperate RGB that way, connect the last pin on the DPDT between M0 and grnd. When you flick the switch you will sever RGB from one monitor to the next, and gnding M0 will cause the falcon to kick into VGA mode, open cct is TV mode. Tv mode is fine for most RGB monitors. Note tho that unlike the ST the Falcon will NOT change monitor types untill you change resolution. What I do is keep it set to 640x480x256 or 16bit then change to 16 colour flick the switch and bobs your uncle.

Mark

> to see more people enjoying an advanced configuration.

I got the impression that that's exactly what one needs to be :
lucky during the installation. First I had N.AES 1.2, Mint 1.9 ? and
GCC 2.8.1. and some thing worked and some won't. When I upgraded to
N.AES 2.0 and Mint 1.15.5 I also tried to install GCC 2.95.2 but
except for 'hello world' type of program it never worked. rpm I also
never got to work. After some weeks of trying I threw everything away
and installed the old KGMD and GCC 2.8.1 and somehow I've hit a
combination where for the first time everything works really well.
The only drawback is that sometimes I look at the sparemint pages
and see all the new things that I'm not able to try. So any attempt
to create a new package is highly welcome and I'll surely give it
a try.

> 6) some betatesters would be needed as well. (MiNT newbies prefered, or

I certainly have no objection to any discussion about good or bad
dealers being continued in a separate group, especially if it will stop the
drift away.

I will still post answers to any queries in my own
name and not, as Vermin suggested, using an alias.

I am pretty certain Vermin and co would object to this as it would deny them
the larger stage on which to ' perform ' but maybe it's worth a try.

Comments?

That's just it. I don't know which of the icons in the RSC are conflicting.
Is there a simple way of finding out rather that renaming all of them?

Joshua.

I think the problem has been that later postings (by all parts) has had little
or nothing to do with the good/bad dealer issue. Lately everyone seems
to have been busy finding new ways of insulting each other.

Hence why I suggested this particular thread should move.

The original discussion is important, but nowadays there is no real
discussion going on anymore. It has become a pie-throwing contest.

It's confermed Lord Gaiyan as it does exactly the same on mine. Time to
dust off my resource editor....

I certainly do. Along with Mr Adez and Sean.
As i have stated before, you don't have a clue what your on about, you
wern't there.
Come on. Answer the relevant questions put forward in the message a few days
ago.
Or do you need time to formulate a different story. A bit like with the VAT
one.

I am accusing you of being a liar who seems to think that living
in Belgium gives him the right to hold a Kangaroo court. You are not judge
and
jury (even though you seem to think you are) and sooner or later this will
be shown.
I can trade as many insults as you can think off and i will continue to post
in this way
aslong as you and your side kick does. I must say that at least you had the
guts to try
and back up your stories. This is something that your side kick will never
aspire to.

Dave

BTW Answer my initial questions, are have your guts dropped into the lower
reaches of your underpants.

OK I tried swapping the drive with the one inside my external drive case (the drives are identical sony drives) but the second one dosen't seem to work.

I can't see a jumper anywhere on the second floppy drive to make it act as drive 0. is the jumper on the ST motherboard anywhere? if so, where?

Thanks again for your help, it is much appreciated.

Chris.

I have this in my Hades:

a new SONY HD 1.4mb MPF920-Z (DS0 modified by myself)

Which is for the most part TT compatible, the Hades that is.

I would not move any pots, could render the drive useless
or mess up some critical timings.

Hi,

I've used a external Golden Image drive on my TOS 1.62 STE for years with
no problems. The internal drive is stock.

GoldenImage made great external drives! Anyone have one or more for sale/trade??

If you modified the PC drive correctly, then there shouldn't be any problems.

You may want to try a different external drive Cable. I bought a second hand
one that was bad. So try another cable if possible.

6198. Re: PC emulation - DOS running on STe

Newsgroup: comp.sys.atari.st
Date: 2001-05-16 17:29:44 UTC
From: phantomm@bellsouth.net
Message-ID: <cOyM6.2256$M8.123193@news1.atl>
Source record: 46327

I've never tried a software only PC emulator.

But I have the FalconSpeed 286 board which has a 16mhz 286 on board. It may
not sound fast. But it really is! Runs DOS 6+ very nice as well as Win 3.1.
Makes use of the Modem Port, Printer Port and etc..Runs DOS Communications
and NET software extremely well. And will drive the modem port up at least
57600! The reason it works so well is because its running on a Falcon!
It includes an ACC that allows you to switch back to TOS and DOS really
cool if you need some PC compatibility. Also allows up to 256Colors in DOS,
but only 16 Colors in Win. 3.1 which is a drag, I Know it can do better
than that if someone were to write a good driver for it. But you do get
very large Resolutions in Win. 3.1 mode. 800x600 and larger.
It plugs into the Falcons expansion port with no soldering or recasing needed.

On the MegaSTE I use the ATonce 386SX board which has a 16mhz 386 chip.
Optional 512K of FastRam (got it) and Co-processor (looking to get it).
This is a very nice board if you can find it. It just plugs into the MegaSTE
processor socket and has a socket to plug the STE processor back in.
No soldering. There were versions for the Mega ST, 1040STE/MegaSTE
not sure about the standard STFM.
I've not fully explored this board yet. But AFAIK the Modem and Serial Ports
are supported as well as the printer.

There were other Hardware PC emulators for the ST. SuperCharger which connects
to the DMA port. I've got one of these. Also PC Speed and a few more, of
which I would like to get ahold of. Anyone thats has one for a 1040STE and
MegaST for sale or trade then hollar at me!

OK this Sony mech /isn't/ off an ST but may hold some clues as it's of a computer aound thesam period (and DD). Look straight at the drive from the view as you were putting a floppy disk in and at the far right back corner should be a switch. I don't have a Sony mech for an Atari ST, but the one I saw looked very similar. The model I have is MP-F11W-L2. I hope this may help you.

Pardon??

ftp://heracles.rma.ac.be/atari works just good (today 18:12 GMT).

The new server ftp://chapelie.rma.ac.be is however still not very
usable. Anonymous users sees only an empty dir. However if you know the
exact path and name of the file you can get it.

Don't worry sooner or later the problem will be solved. The main problem
is that the webmaster is a student who's doing this on his sparetime.
Right now he gets some help from an ex-student but alas that guy is
abroad until thursday. He has promished me to dig into the problem as
soon as he's back. The last time I've talk to him he said he had a good
idea of what is wrong.

HTH,
Martin

Great idea and I hope this can be done!!

I use Geneva/NeoDesk on all my Ataris from the CT2B Falcon to the 1040STE.
Compatibility is excellent! Especially on the CT2B Falcon. It's as Stable
as normal TOS 4.04!
However I've always wanted to get into MINT, either as a replacement OS or
with Geneva, but the problem for me is the amount of time it takes a person
who is New to Mint to get it installed correctly and setup for maximum
performance on each machine.

Dan if you are listening, Will we ever see any updates or bug fixes for
GENEVA or NEODESK???

I do have a MINT CD here titled "The Complete Atari Mint 1998" by Whiteline
CD Series but as far as I can tell, it really doesn't have a installation
process. Which is a must for those new to MINT and don't have the extra time
to search thru tons of docs to get things set right.

I think that there are alot of Atari Users out there that would like to get
into Mint and see something like this come about.

Also I need English Docs, translators do help, but things still get lost in
translation programs.

I'd be willing to be a Beta Tester or help any way that I can.
I have a CDR drive and several CDROM drives. And several Atari systems,
some stock and some upgraded. CT2B Falcon, Stock Falcon, MegaSTE, MegaST4,
1040STE, lots of Video digitisers and equipment and a nice Music/D2D Recording
setup. I can do Color Video, Graphics, and Music/Sound if needed.

If I can be of any help just hollar at me...

6205. Will this disk drive work in Falcon or MSTE???

Newsgroup: comp.sys.atari.st
Date: 2001-05-16 19:34:15 UTC
From: phantomm@bellsouth.net
Message-ID: <XCAM6.2271$LM5.71231@news2.atl>
Source record: 46341

Greetings...

I have a new 1.44 disk drive and was wondering if anyone has used this model in a Falcon or MegaSTE.

It's a SONY Model MPF920-1

On the back it has the ribbon cable connection, 4 pin connection for power,etc. And that is it except for a large round component that looks like the back of a POT. I'm not sure what it is, I'm thinking that it may be somesort of switch as it looks like one might turn it, but not sure. It's connected to the PC board by a small copper ribbon cable.

Also there are no other componets on the PC Board that I can see, only a few empty holes.

On the bottom of the drive are a few access holes which have soldering connections and are labeled. Also there is one hole with a small POT labled RV1.

Is this a good working replacement drive for the Falcon?

How about as a replacement for the internal drive on a Mega STE??

And could I use it as a 2nd external drive on a MSTE if I put it in a ST GoldenImage external drive case??

I would also like to know any brands and model numbers of 1.44 drives I can use in Falcons and MegaSTEs for the Internal 1.44 and as a 2nd external 1.44 drive.

>
>Are you sure that old, dusty one in the back of the cupboard is not for
>sale? :-)

Not at this time. I am going to try and get it repaired. I've done some work
on it, but it still needs some tweaking and maybe a chip replacment.
If I get it working correctly then I may sell it, but I really need it as
a backup as they are so hard to get ahold of.

>It all depnds on price. I don't really want to look like a pickle.

Not sure what they would ask for one. But other than the ScreenEye the Expose
is the only digitiser that will grab Color video.

VideoMaster Falcon (The Falcon only version) is a good 2nd choice. While it
doesn't grab Color Video, it will Grab TrueColor Stills and Grey Scale Video
or a 1 ColorScale type video such as shades of Blue, Green, Red, Sepia and
etc. And does a fine job of grabbing Audio and Video together at the same time!

One can load color .TPI pictures made with VMF or TruePaint/TrueImage into
the VMF software and make color video that way, but it takes some time.

I really like the VMF and have 3 of em with Splitters.
I also have the ST/STE/Falcon version, but it is no were as good as the Falcon
version.

YES!!!!

A RedHat-style easy installation for MiNT is Long Overdue.

Well, maybe not THAT easy, but something that has a sufficiently friendly
blend between good instruction and automation that MiNT dummies can
handle. And an up-to-date selection of kernel and utilities. That work
on most/all setups (e.g. my STfm).

I'd buy it. 'Course, I'd rather buy it from ChroMagic or SystemsForTomorrow
or some such in the U.S.!

Dan,
First I have heard of this problem.. any other details you can give?
Mint? Magic? Cab.ovl?

If you could.. try www.atarinews.org 's poll.. let me know if you have the
same problems.

Thanks

Rob

HD of course. Reomved the metal plate on top, found 2 solder pads
labeled d0 amd d1, or ds0 and ds1, I forget the exact label.
Took the solder blob off the one labeled ds1 and place a solder blob
across the one labeled ds0. The Hades now sees the drive as ds0.
Put the metal plate back on of course.

Follow the traces from pins 10 and 12. Pin 10 is DS0 and pin 12 is DS1.
Those pins will lead you to the solder pads.

Hi,

I don't have much knowledge about Mint, but I do have a burner, Web knowledge, Fast internet connection, an STFM, Mega ST, and hopefully a Falcon. The Falcon is dead at the minute but I hope to get it fixed though.

I could help with documentation, both text based and web based.

I could help with cd production Software uploading.

You name it and I'll give it a go. It's about time I did something good for the Atari community ratger than sitting back and learning off you guys.

As the topic suggests...

The long standing (rare) DCC file get bug has finally been fixed.
This was the one that appeared as 'No waiting DCC operation found'
even though you knew there was a file waiting.

Thank Ozk for this one! Been chasing this one for ages.

PS. If you repost this on a news site you must mention Ozk. :o)

Tim,
Thank you for your help, we need as many people as possible and your help
will be greatly appreciated.

Do not think that because you do not code that you can't help.
Coders just hate to write docs, that's a fact.

The more people on this project (even if it is to create a 24x24 pixel
GIF) the faster this project will be completed. The better the quality
will be.
It's an atari thing, you will learn a lot, organization,
betatesting skills, installation procedures, deeper knowledge of your
graphic software maybe even, might even also learn something about
databases, meet new people, learn new software, the list goes on.
I would like to see a strong community spirit coming back, all working for
the same goal, a product we can be proud of.

If time was free and unlimited it is a win-all situation.
Web developers (in QED, or vi or whatever) to help maintain the pages, (I
can provide a server with php/mysql if needed).

Anyway, I am looking for more people interested, then we can switch gears
to go forward.

Chances are it's a cableing problem. STE - Incorrectely wired external
drive. Probably
a power computing one. Check out http://www.keychange.co.uk he will be able
to fix
it for you.

Probably not a bug in TOS or the controller, most likely not a compatible
STE drive.
Inspect the connector pin out's for a clue.

I could sell you a compatible one but could i take all the shit from this
group?

Everyone,
I am an avid computer user!!!!!! I have used all kinds of computers from a TI-99/4a to a 1 GHz. PC!!!!!! And yes ATARI, from an 8-bit 130XE and a 1040STf with 2.5 megs of RAM to a soon to be upgraded FALCON!!!!!! I recently read a newsgroup response from an unnamed developer that said that atari is dead and that there will be NO more development from software developers and that the XTOS project will find itself in the same predictement!!!! I dont agree, there are alot more users out there than just in this newsgroup. They just dont realize all of the stuff that can be done on the atari!!!!! I have prided myself on trying to purchase and support even shareware software and buy new software from developers. To think that there will never be another browser ever released for the atari ST compatibles or newer clones is obsurd!!!! Stand up and be counted. I use to own a PC so dont think that I have lack of experience with the newer computers I also work with a PC which crashes almost weekly!!! I am disgusted with the fact that it takes 128 megs of RAM and 5 to 20 meg programs to do a damn thing on that type of computer. That is not necessary and if more people would wake up and smell the coffee they would realize that MICROSOFT is nothing more than a MONOPOLY!!!!! If you wanted to go out an buy a new car which would you choose???? Several different brands and several different models with different options!!!! The PC does not give you this luxury. You are stuck with the same type of processor (sure they have different speeds but the technology on a 700 mhz is the same as a 966MHz.) and you are most definetely stuck with WINDOWS (that shatters all to often)!!! So stand up and protest people who say that the atari world is dead. Becasue in my eyes and several thousand other people it is most definetly NOT!!!!!!!

Thanks,
Carey

hi edward,
if people would only look at this atari market in perspective, and realize that this is a rebuilding effort on a very small scale. it will never be like before, but it can be somewhat active, and stabilizing if some of these programs, and hardware projects come to bear(tempest, milan III, xtos, cuzuba, etc.).
mario's project has stirred some interest, and if more like this can be done, you never know how much fun can be put back into atari computing. there is still a lot of interest in many old platforms, just look at commodore, or even the old atari game machines.
the st market is going thru right now what the 8-bit market went thru 10 years ago, the demise of antic in the summer of 1991 was a real blow. today get on the 8-bit news group, and there is still activity, and there is not even a browser for them, but there is activity.
the st/falcon/clones have a jump up on the others, you have a browser, and the ability to connect to the net, that is the greatest asset, and it can be built upon, do not let it slide.
thanks,
lance

These are the Atari ST programs that I have for sale

$125 plus shipping or best offer

Rorkes Drift
Gettysburg
Armada
Star Trek :Basic version
Police Quest (Three Program disks and three copy disks)
Regent Word II (word Processor)
Lesiure Suit Larry II (three Disks), plus Copies [At least eight total so far]

Stellar crusade [game and scenario disks]
Carrier Command
Warship and save disks
Colonial Conquest
Advanced Dungeons and Dragons: Heroes of the Lance {disks A.B & C]
Empire: Wargame Of the Century
Simcity
Civilization (three disks)
King Quest II
BloodWych
Jewels of Darkness
The Sentry
Silicon dreams
Financial Cookbook
Assempro
Lords of Conquest
Stumble Blocks
Cinko
Monopoly
CardMaster
Sorceror Lord
Test Drive {two disks}
Universal Military Simulator
ST Assembly Language Workshop
Lords of Conquest map disk
Atari ST USA language disk [Shrinkwrapped and unopened]
Global commander
St hard disk utility backup
Dungeon Master editor
Dungeon Master utilities
Drakkhen [two disks]
Dungeon Master main disk
Dungeon master hint disk

Carrier command game disk and save disk
Mega ST system disk
Spectrum Holobyte Tetris [two disks]
Legend of Faerhail [four disks]
Copy of Original hard disk back utilities
Mega STe Advanced Hard disk utilities
Defender of the Crown [two disks]
Mindshadow [two disks]
Risk
Flight Simulator II
Tv Sports football
Wizards of the crown game disk and copy
Wizards of the crown save disk and copy
Bloodwych save disk
Silent Service Submarine simulation
Atari St User Cover Disk 45 Agust 1990 :Side 1,Runtime,Degas Display,and a playable demo {unknown]
Side 2 Breakout,Flexmono, magbase, xbios

St Action Games disk 11: Nine lives, Turrican, Saint Dragon, Spellbound
Dragon's breath [two disks]
KIng's Quest [two disks]
Middle earth {three disks]
Phantasie [data disk, game disk and two copies of data disk]
Phantasie III: The wrath of Nikademus [game disk and data disk plus one copy of each = 4]
Rings if Zilfin {three disks}
The Chessmaster 2000 (game disk, data disk and copy of Game disk}
Shadowgate {two disks}

MicroLeauge Baseball {Five Disks} Game & Box Score disk,General Manager/Owner's Disk,Stat Compiler
Disk
MBL 1987 Teams and copy of 1987 MNB disks

Hillsfar {two disks and save}
Faegerhail save disk
GFL CHampionship Football
Crunch Time Football AI Doctor
TV Football Leauge Disk
Gold Rush {five disks}
Star Trek: The Rebel Universe ans save disk
Psycnosis {four disks}
Armada data and program disk
Exodus: Ultima III {five disks}
Timeworks {seven master disks and seven copies] = 14
Zork Trilogy plus game disks and save disk = 3
Wordperfect For the Atari ST {five disks}
Laser C {three disks}
Knight Orc {three disks}
Populous {two disks}

Populous: the promised lands

Breach= Scenario disk,Program disk,Seraychi Campaign disk, Game disk, plus three copies Totalling 7 disks

Breach two= five disk

Compute!'s Second book of Atari ST and Copy

Compute!'s Atari ST disk

Some Quantum drives(I had a Lps270) only work with the SCSI parity feature provided by the host(adapter),due to a HD firmware bug.This aint possible with the Atari hostadapter.I exchanged the internal adapter(forgot model),and at least external ones may be still acquirable somehow.Only other possibility:get different hd.The first LPS series didntï¿½t have this problem,and later drives of the second series(yours) may have this bug fixed.

With some quantum drives there was no way of disabling parity(hd firmware bug).I had such one,and i remember a neverending thread on Maus-Netz about this topic.

Mint itself runs fine on my CTIIB Falcon. Only thing that somehow
didn't work was updating packages from the sparemint rpm archives.

Hi:

I'm looking for keyboards for my small pile of old megas.
I can get floppy drives from Keiths Atari, but I could also
use an extra monitor or so.

Thanks..

D.

As far as I'm concerned it's sweat, as in underarm and smelly.
Probably fat and ugly too, with a very firm grip, (according to his only
friend,)
but I've never met him so I'm guessing.

> "Knowingly", thats a nice word, one that will make you wonder for the
> rest of your life if the next stamp you lick will end up at my door.

I don't care either way, except that,
1. I will already have your money and
2. It could mean I then had your address to send the court docs to.

Laff now, pillock.

I have new Mega STE keyboards with some Spanish keytops and some used
Mega ST keyboards in English and German.

For info.

1. The keyboards type using the language of the host machine.

2. All the letters and figures are usually in the correct places.

3. I move some keycaps to the nearest suitable position.

4. There's about 5 keycaps that need labeling but they don't appear to have
bothered the 20 or so current users.

I have an Atari 1040Ste brochure for sale if anyone is interested. I would take $3.00 for it. It is in great condition; still bright colors and sharp text with no fading. There are creases in it where it was folded in the envelope and shipped to me way back when. Copyright date is 1990. I am sure shipping would be very cheap so I will just charge $1.00 for postage.

If interested, please Email me directly at tonym04@aol.com

Dan,

Looks like Cab is not reading the url.. it's suppose to send the
vote to
http://www.atarinews.org/pollBooth.php?op=results&pollID=6&mode=&order=0&tho
ld=0
Looks like Cab is sending it to..
pollBooth.php?op=results&pollID=6&mode=&order=0&thold=0 and not using the
full url. Is this what you are seeing?

I'll try and add the url to the poll "link" in the php codebe a while.. too
busy .. but it might lately.
But it looks like this is a Iconnect-Cab.ovl problem. From what I know
Stik/Sting users have no problem with the link.

If anyone else has this problem.. please let me know!!

Rob

Yes, I have ordered stuff from him a couple of times. Most of the time I
am against constant spamming of newsgroups, but this guy is legit, has
really good prices on software, and a large inventory. He also
has a very quick turnaround on orders.

There aren't a lot of good places to get Atari stuff anymore, so I wish
people would just get off his back. Please not that comment is not directed
at the person asking this question, just a general statement to the public.

Phil

Please capture this post and add it to your massive pile
of evidence. At some point one has to draw the line,
and now I'm certain I would never purchase anything
from you. I was considering a keyboard, I could of
swapped the keycaps from the dead one, but now I'd rather
do without.

Such talk... I understand one might want to
defends ones own honor, but this stuff is crossing over
the line into plain sillyness. If the original problem

was false to begin with, and you claim you are not loosing
customers then for heaven sake don't stoop to their level.
Now you are loosing customers. I won't read this thread anymore,
it's my own fault for doing so.

So as is the drive should work in a Falcon or MegaSTE as Drive 1.
But if I wanted to use it as a 2nd 1.44 drive then I would have to modify it?

Right now all my stock Falcon and MegaSTE drives work fine, but I do have
a Falcon Mother Board here that needs a 1.44 Drive and some other work and
bought the Sony to use as a replacement.

Also wanted to install a 1.4meg drive mech into a GoldenImage DD drive to
use as a 2nd HD drive on my MegaSTE. If this Sony can be modified to do so
easily then I will by another one or two.

MiNT work perfectly with CT2.. Right now im betatesting new kernel
which enabley memory protection on CT2 which was not possible till now.

to all:

Someone mentioned updating of kernel and tools.. CVS repository is
ported on MiNT quite some time, and via CVS u can get almost daily updates
of things in development.. Also redhat package manager is arround qute a
long time, so i suggest anyone interested in MiNT to check
www.freemint.de and www.sparemint.de and check in person whats going on in
MiNT world and there is a LOT of happening...

Hi All,

As the new version of PhotoTip surpasses Image Copy 4 in many points, we
decided to remove the FaST Club programs from our catalog.

Bye,
P. Ricard (ES)

There surely happens lots of things in the MiNT world but I think that
for quite some users (including myself) CVS is out of reach. I don't
have problems with RPM though, except with one ghostscript which refuse
to install.
I can't imagine how live would be without MiNT.

I thought the orginal STs had tos on floppy? Or at least gem...?

I did have a floppy that had TOS 1.0 on it (my ST had TOS 1.02 on ROM),
I remember buying this from a PD library - why I dunno! :-)
But I did have one. Anyway, you need the boot block of the floppy disc
to automatically load the TOS.IMG file so that it bypasses the rom TOS.

I'd love one of these also, wish I still had mine! :-(

You don't need a boot disk. If no disk is inserted the desktop
should appear in less than a minute. If ANY readable disc is
inserted, it will appear much quicker.

>Right now all my stock Falcon and MegaSTE drives work fine, but I do have
>a Falcon Mother Board here that needs a 1.44 Drive and some other work and
>bought the Sony to use as a replacement.

Falcon does not support an additional drive as B, although TOS does! THis
is from past experience and Mark also experiencing this. A small hack is
needed (soon to be tested)

>Also wanted to install a 1.4meg drive mech into a GoldenImage DD drive to

Hmm, AFAIK the ST to Mega STE had the same pinouts for the external floppy
port then you'll need an aditional line (to tell the mega to switch to HD
mode) and possibly some simple logic involving the disk select lines.

There is also an emulator called SoftPC

www.holleman.demon.nl

I tried it on my Milan but it requires 640x400 16 colours so I think
that limits it to Falcon or TT. Maybe it will run on a Hades but I
know it doesn't work on my Milan because I can't get 16 colour
screens, which is a shame.

I once wondered if it would be possible to convert a DOS executable into a TOS program but there is probably too much reliance on PC hardware to make it work.

Hi Folks.

For anyone interested an Atari 520ST with 24 games + mouse +
joystick,one is tonight being advertised in the "Forester"
Newspaper. I have just rang the number to check that it is still
there,and asked permission to post their telephone number on the
Atari lists.

Asking price is £25
Their number is Tel:01452 423364

Location is UK.

Cheers,

~ Paul ~

Yes, I have one.

>If so, how do you like it?????

I'm extremely pleased with it.

>Does it give any problems with operation of the computer?????

The driver software fVDI has a few difficulties with some programs, but it has some variables in its configuration file that you can tweak. For example, I find that GTLook won't work unless you turn on the xbiosfix switch. Papyrus Office bombs when you try to run a report, but the only way I've been able to work around that is to disable fVDI. Disabling fVDI is a bit messy if you also have NVDI because you have to delete/rename the 5 NVDI driver files. Some programs also won't redraw their windows correctly, leaving black holes, but this has been improving with various releases of fVDI. Make sure you get the very latest release from the author's web site!

Anyway, I'm running at 1024x768 in more-or-less true colour at 75Hz refresh, at the speed of a Falcon in 16-colour 640x480.

>I am thinking of upgrading my FALCON with cortex
>designs TEMPEST accelerator and there ECLIPSE graphics card!!!!! Once
>I know whether anyone has this card and can tell me any pros or cons
>to it I will be able to decide if I want it now or wait till the bugs
>are fixed!!!

Two problems which *may* hinder you are:

1) I'm not sure Eclipse is in production any more. There were some problems with the supply of the Rage graphics cards.

2) Tempest is not released yet and doesn't have a definite release date. However, I'm assured by the developers that the project is still underway.

Source record: 46159

PS. I relate some of my difficulties for your benefit and for anyone else's benefit!

1) The version of fVDI that Cortex supply with Eclipse is hopelessly out of date and very buggy. As I mentioned, get the latest version from the author's web site first.

2) The configuration file that Cortex supply will not work. It isn't even set up to recognise the ATI Rage card so it has no hope of working! If anyone wants a copy of my working file, let me know.

3) The fVDI option to configure the resolution and number of colours interactively at boot time doesn't work (at least I couldn't get it to work) and simply corrupts the fVDI program, needing a restore. I have to explicitly hardcode the configuration and edit it and reboot when I want to change.

4) The installation of the hardware is relatively painless, however it does require you to cut the main power supply lead inside the Falcon to feed it into Eclipse! This was extremely fiddly and nerve-wracking for me - the cable just isn't long enough.

5) The ribbon cable that connects the Eclipse board to the Rage board wasn't long enough to fit the Rage board inside my tower case. I had to feed the cable out through the cartridge port hole and sit the box externally on top of the tower case. I've not got an extension cable to allow me to put it inside the case.

As i implied (in private) many months ago this situation could
never have a winner and would cause offence on both sides. I have
kept quiet for 6 months but after postings implying fraud and bringing
my products and customers into the fray then I'm afraid I have had
enough. I know a lot of people still active in the scene and they have
informed me what else is being said.
You well know that up untill now i have always been an extremely
polite and placid person, I never took the piss out of anyones technical
ability and spent many hours talking people through fitting parts supplied
by myself. However, other members of this group have enjoyed causing
offence and i really believe that they have taken the piss out of yourself
just as much as they have tried to do to Barrie.
Posting back to these people in an abusive way is the only language
they understand.

> As far as the drive goes I wouldn't dream to question your technical
ability
> on this but you *must* be missing some crucial information somewhere - and
reading
> Barrie's accounts It's obvious that he is - in a big way. But I've said

My comment was only directed towards Mr Sweet, please do not
take it out of context. As i have said before you see it your way
and he sees it his way. Are you really happy that it has esculated
into todays mess?

The main problem i have is the continuall attacks on each others
character, Dennis seems to think that what he posts is the
truth, the whole truth and nothing but the truth and is holding
a Kangaroo court. All i want Dennis to do is answer my

questions put to him in previous postings.

I am sure that once it goes to court we will hear the truth.
Enough evidence has passed between postings and i am
sure the group has had enough. Why not stop the remarks,
let it go to court and then we will see.

Dave

If your not reading the thread any more then this won't
matter.
But if you are then before you go just take a quick look at how each
of these bitter threads develop. Who are the instigators?
There are 2 people starting the arguments and what for? Self gratification?
All i can say is you would be missing out on a good deal, but what
do i know for i am meant to be "The Ultimate Scam".

Dave

>Really.
>I must agree that the case against you just looks better and better.
>As i said you haven't got a clue.
That's your personal opinion. But then that's worth nothing, someone far
more qualified will consider the cases and decide how strong they are.

>If you are so right then answer the question. Where you there? Do you
>have first hand knowledge or are you really Betty?
Ofcourse I wasn't there, since when does one need to be present at the place
of a crime? wouldn't this make me an accomplice?

>> >BTW action will still be taken against the online magazine if any more
>> >rubbish is posted in the same way.
>> Sorry mate.... wrong newsgroup, wrong thread if you ask me. Has anyone
>> here any idea what he's on about?
>Ask Shiuming Lai you ignorant stain.
See, that wasn't so hard was it? if you got something to say, just do it.

>> Just like your mate Barrie
>Assumption or truth?
Since you claim to be there all the time, I assume he's at least a mate.

>> you seem to think we've got a crystal ball
>> here. What online magazine is posting rubbish? what's it all about?
>> Define "rubbish" please.
>>
>What you type.
Point taken.... now please answer the question. It should be obvious by now
that nobody here has a clue what you're on about. Has anyone noticed any
"rubbish" being posted in the online uk magazines lately?
Luckily you noticed it, or it might have slipped through unnoticed !!!

>> What on earth is TUS? The Ultimate Scam ?
>Nice one.
>Believe me it's been called worse, you can insult me all you like
>but be prepared for a barrage of abuse back. You see i am no longer
>active in the Atari market
You seem to think you're world famous.... believe it or not but I didn't
had a clue who you were. And as for TUS... I remember seeing some ads in
the old Atari magazines, so what? over the years I've seen hundreds of adds
of now defunct dealers.
What's so difficult in calling a horse a horse?

>>I don't wish anything, if you want to make
>>yourself ridiculous, go ahead and post the pathetic retraction, who
>>knows what might fall out of the cupboard....
>>
>A complete arse hole could only make a comment like this. He well knows
>that the reference is to Shiuming Lai. Care to comment you gutless prick.
No not really, you seem to answered it already :-)
I can't really see Shiuming Lai writing pathetic retractions, I don't
remember seeing any public retractions lately in any of the English Atari
newsgroups and I can't recall any such threads either.
Frankly spoken : you asked if I wished to see you post it? YES please ...
unless I see this with my own eyes I'll assume it's just a figure of your
imagination.

>P.S. Do you want me to email you a few arse licking web sites.
No, but thanks anyway.
I would strongly advice you not to email me, since the reply could upset
you somewhat.... heaven knows what might come attached :-)

Cheers from Belgium
Dennis

>Firstly, I would like to appologise to the group for my abusive language.
>However, this is not extended to the the intended recipients.
...this is the lamest excuse I've heard in years.
Your postings were targetted towards me, why you needed to use abusive language in the first place is something only you know. I assumed this kind of language comes natural... anyway, if you think I'm going to step down to the same level, you're wrong.

>I have read the groups for many years and i find it difficult to believe
>that a couple of regular contributors can hold a Kangaroo court whilst
>others just stand by and watch.
Although you claim to have followed the different threads on this topic and read the arguments of both parties involved, yet, you haven't noticed that a great deal of the regular posters aired their opinion on this matter?

You must think it's full of idiots here... You know very well that everyone here will ask and even plea to stop this thread.

>As you are probably aware Barrie used to help out on my stand at
>the shows and is competent at repairing ST's. I have passed on many
>of my former customers to him over the past year as i now develop
>parts for the PC and don't have the time. You people know how much
>effort i put into TUS -
AFAIK no one is questioning Barrie's competence. And no one is questioning TUS either for that matter, why do you feel you have to defend yourself?

>would i really put my trust in Barrie if i thought he was going to swindle
>them.
Probably not, but how can you possibly know someone his real intentions? no one claims Barrie swindled certain customers *willingly*. I know very well that every story has two sides... I admire the way you stand up for a mate and fellow collegue, but the methods used will not give you much supporters for the case I'm afraid, it should be pretty clear by now that using abusive language to get your points across, has a negative effect here? one of the reasons I stepped in was because of the abusive language being used against some of the people here in the first place....

>The customer from hell always comes along at the wrong time and some are
>hell bent on causing as much trouble as possible if they don't get their
>way. I will be the first to admit that not every job went well and i took
>some pretty drastic action with some of them. If any are reading this
>then feel free to air your complaint.
I don't think a business with only satisfied customers exists anywhere in

the world. Certain deals are bound to turn "sour" from time to time.
But again... no one is questioning this either. The way in which this deals
are handled are important, Barrie may be very competent, but when it comes
down to public relations...

>Sean's hard drive.
>Believe me, Sean has been very conservative with the truth on this
>one. I have stated previously "i know because i was there". I really
>should not elaborate any further because of the pending legal action
>but i will say that i checked it twice - DOES MR SWEET WISH
>TO QUESTION MY TECHNICAL ABILITY.
That's what happens when you don't read threads completely.... care to
elaborate on selling a custumers property without his consent, and then
refunding him only a fraction of the value... (this has been publicly
admitted)

>Alleged Replacement of Superior Parts.
>ie Veloced STE with a Mega
>Once again not too much can be said in public. What i would advise
>anyone who wishes to know should contact Mr Lai who would
>appear to have spread the story and has since tried to retract it.
You've got your wires crossed! I don't recall reading anything like this
here. AFAIK this has nothing do to with Keychange either, unless you know
better?

>What i would advise anyone who wishes to know should contact Mr Lai who
>would appear to have spread the story and has since tried to retract it.
Not even mentioning the fact that it isn't very polite to put someone in a
dark spot while he's unaware of it and not able to defend himself....
This is what you're playing at.... you don't really give a toss about the
Keychange soap story, you've got some personal beef with Mr. Lai and want
to involve the newsgroup, nearly all your postings have carried some hints.
If something is bothering you, why don't you just throw it out in the open?

>Any spelling mistakes are not deliberate. Grade 5 CSE you see.
>Ah well, we can't all be perfect can we Dennis and Steve.
You conveniently seem to forget that English is not my native language,
meaning that my postings are bound to carry some spelling errors and that
some of the sentences will be build up rather awkward, so what?

>BTW Should i start spreading stories about the MOST reputable of
>UK based Atari dealers into the group. I can certainly tell a few,
>i know because i fixed them after they stuffed up.
Does it make any difference if anyone would ask you not to? it seems to me
that you're going to carry on anyway....

Cheers from Belgium

Hi Joshua,

>That's just it. I don't know which of the icons in the RSC are
>conflicting. Is there a simple way of finding out rather that renaming all
>of them?
Jinnee has a peculiar way of indexing the icons. You've got to make sure
that the icons *inside the RSC* all have a unique name.
Open PPP.DATEI.RSC with a RSC-program (Interface, RSM etc..), click on
TREE1 and rename all icons in the RSC, most likely they are all called
"ICON". It doesn't matter what name or number you assign to them since
Jinnee doesn't use these anyway. I normally just assign a number to them
like "ICON01, ICON02"... etc.

While betatesting Jinnee I came across this problem several times and
like you could not figure out what was causing it. Eventually Manfred
Lippert pointed it out to me.

Cheers from Belgium

It has been interesting.

6288. Mega ST Internal DMA Connector question

Newsgroup: comp.sys.atari.st
Date: 2001-05-18 00:25:51 UTC
From: Christopher Friend <rangerfiendNS@NSyahoo.com>
Message-ID: <tg8r2bc9mmfr71@corp.supernews.com>
Source record: 46166

Does anyone know what the pinout of the Mega ST Internal connector is in relation to the external DMA connector.

In other words: Internal Pin1 = External Pin ?

Thanks
Chris

>Joshua.

Then I would do this. I would go into the icon folder that Jinnee uses
and delete one of the RSC files, then load in the new file. Keep doing
this until you find the one with the icons that are causes the new file
not to load. Then load that file into a RSC editor to see if you can
identify which icons are conflicting.

Well the Atari platform will never die. There are many diehards, like
myself, who still use an Atari computer as their main computer. Then
there are MANY ex-Atari users who are still running Atari programs on
their PC's and Mac's under emulation.

Hello Carey,

I know which developer you are talking about. I do not agree with him either, but then he is selling a very good product and is not making harly anything, so I can see his point. One of the biggest problems the Atari market has had in the last 20 years, is that many Atari users just do not want to pay for the programs they use. The pirates really hurt the Atari platform back in the 80's and 90's. But like I said, the Atari platform will never die. I have been arguing this for the last 15 years with people including my wife who is an avid PC fan. There are still many diehard Atari users like you and myself who use an Atari as their main computer. Then there are the ex-Atari users who are still running Atari programs on Mac's and PC's under some kind of emulation. The support is out there, you just have to find it.

I did get SoftPC to run on my Hades, but I had to run it in a 256 color mode. The resolution I was in did not matter. I ran it in 800x600, 1024x768 and 640x400. I could not get it to run either until I ran the little program GET_REZ4 before I ran the main program.

An enterprizing person should set up shop at the Mall of America in
Bloomington, MN to offer one of kind Atari stuff. The Mall caters to
70,000 on a slow day and upto 300,000(mostly tourists) a day on a busy
day. Usually distinct shops populate the mall such as Sharper Image
and the new Bose store. Look for the new Apple store soon. Airlines
have special rates for travel to the MOA. Saw two folks wearing black
fugi shirts at cusa last week. So there must be interest...

linux is real, but not the peaces platform, that is a overblown
calculator that masquerades as a computer thru software emulation.
i agree with edward, you have to find support, as well as users for
alternative platforms, and the apple is a alternative platform, its a
good one, but the peecee has crushed everything else even if you run
alternative not so bad software on it, it still sucks.
i see nothing that can halt the march to utter domination of the peecee
in the future, but that does not mean we have to roll over, and die.
anyone remember the avanti from studebaker? it lived on for years after
studebaker went under, it is kinda like the clones, small market for a
really cool machine that really can be impressive.

sinclap,
atari did that way in the past, remember federated department stores? they also did that with some jaguar only stores. both were flops, and when a company has to set up there own stores it looks like a market share problem. now jobs is no jack, jobs is much smarter, and may pull it off.
i have thought about a mall of america store, but the price is way more than i can afford, as well as inventory problems, when you run out of something, you just cannot pick up the phone to reorder. but i bet if i could do it in say november-december-janurary, i could do well.
thanks,

Hey, thanks for reminding me of the freemint pages. Somehow I only
had sparemint in my bookmarks and since I couldn't get rpm to work
I can't use that. But at freemint things are downloadable as tgz.
So I can try whether GCC 2.95.3 works better than 2.95.2 for me
or whether I have to stay with 2.8.1.

Thanks again
Gerhard

I'm sure that it won't work with the Mega, because the bus' are not
compatible. The Mega's bus is a straight "listen" of the processor lines.

I think it could be a drive selection problem...
When you disconnect the internal drive, what is the letter affected to
the external drive ?

With both drives connected and ON :
When you boot your computer, do the drives' selection LEDs turn ON ?
When you try to access to drive A, which drives' LEDs are ON ?
Which ones when you try to access to drive B ? Do the TOS ask you for
insterting a new disk in drive A ?
To check for correct drive selection wiring and correct drive IDs, you
can write directly to the PSG chip in order to set drive selection
signals and see if drives leds turns on. (This can be done in GFA or
with CPX basic for instance). I can give you more details if you need.

Here is a little explanation about the way external drives selection
works (from the hardware point of view).
Each ST computer (from ST to TT) has two way of selecting external
drives. This setting can be altered through two jumpers (or solder
points).
The first one could be called the "diskless" one, it lets the computer
select the first external drive (remember they are daisy chained) as
drive "A" (using the DRIVE SELECT 0 pin) and the second one as drive "B"
(using DRIVE SELECT 1). This is the way the very first STs did work, but
a more recent machine could be turned to this behaviour (just have a
look at a shematic drawing).
The second way could be called the "internal disk" one , it lets the
computer select the first external disk as drive "B" (using DRIVE SELECT
0).
To allow daisy chaining, external drives' internal wiring must use DRIVE
SELECT 0 as their own selection signal and redirect DRIVE SELECT 1 from
the input plug to the DRIVE SELECT 0 of the ouput plug.

AFAIK All ST computers with internal drive must be set to the second
operating mode.
Please note that the external drive selection mode doesn't change PSG
ouputs meanings, but only connection from PSG's outputs to Floppy
connector pins (meaning of DRIVE SELECT pins).

I hope all these will help you finding what's wrong with your system.
Regards, Eddy.

HIya's

These are very handy to have. If you have a machine that won't run a
program or game, then you can boot the machine up with a disk TOS and
99% of the time it will run the awkward software.

I use it when I have software that wont run on the STE/MSTE.

Some early STOS stuff won't run on STE's, or even 1.2/1.4 TOS, and you
can't use the fix programs either. but run fine under 1.09.

I think I have it in my pd library somewhere:P

6315. Aniplay + MagiCPC

Newsgroup: comp.sys.atari.st
Date: 2001-05-18 14:27:20 UTC
From: Lord Gaiyan <gaiyan@vianet.ca>
Message-ID: <LgaN6.338$QW1.3166@newsfeed.slurp.net>
Source record: 46199

Here at work away from my Falcy I'm trying to get Aniplay to work in MagiCPC. Whenever I load up a movie it tells me that I can only use a maximum of 16 colors on a 68000!! I'm running 1024x768 24bit color and it's incredibly fast! Wish there was an actual Atari this fast. Does anyone know how to make Aniplay play movies in more than 16 cols? Thanks.

Joshua.

You needs a 68020 emulation. Lot of codecs and transformations to screen uses
68020 opcodes. Aniplayer has worked under MagiC Mac before Hades ;-)

Regards,

Didier.

There are just a problem with the shutdown because without the MMU tree
of the 'TOS 7.0x' from Centek, the CT2 cannot reboot with TOS 4.0x in EPROM.
The RESET opcode seems not works in turbo mode ... or maybe it's another
problem. There are the same problem with Linux 68K.

Regards,

Didier.

Hm why is CVS out of reach? Compiling? But CVS is mainly used for
sources and betas etc, so main way to get packages is RPM or good old
tar.gz which i prefer... :)

> I can't imagine how live would be without MiNT.

I can, just not happy with results :)

> Yes Sean, IMO you have been.

Like I said before Dave I stand by everything I've said and the ppl around
me
at the time can confirm everything I've said. I can only assume you are not
aware
of the *full* facts but I will leave it at that.

> Can't really say anymore because of the case but what i would like
> to know is "From your enhanced computing knowledge today would
> you have been prepared to help yourself a bit more all them years ago?"
>
Of course I know _much_ more today than at that time *but* the fault
finding process *I* tried to implement would be exactly the same. It's a
shame I didn't
get the support or information from source at that time, but we've been
through all that before. The way this was dealt with amongst other things
(previously documented) was the thing that left a bad taste in the mouth.
In the hard drive case, devices can go wrong - these things happen, but the
response and the attititude you receive when they do is important. The
response recieved was pretty much in the same vein as those posted on this
group for all to see....enough said.

> So are you happy that your version of events have been repeatedly used
> to justify other stories for which i know are untrue?
>
I can only give my full account of the experience I had and if other users
have information than they too have a right to bring this up - as Barrie
requested. I know my version is true (even though you and Barrie disagree)
so now when you say these other stories are untrue what are ppl to think?
You see my point?

Anyway....

Regards
Sean

NO need for such sore reply, i dont doubt how much anyone is
"REAL" Atarian. But emulation do not help in survival of Atari as
platform, practicaly none with emulators only do not buy new software or
hardware and in 99% they are sure their emu is as good as some new Atari
comartible machine so no need to expect they will support that
market.. And that for sure will not help the Atari...

The idea here is that people who are emulating an Atari will use Atari programs and in some cases, even buy Atari software. I have run into that from time to time. I think that these "pretend" Atari fans as you call them, add to the Atari scene. Why emulate something that you think is no good? Many of these ex-Atari users have confessed to me the reason they switched to the PC was not because of the software, but because of the computer being behind the times. To each his own...

Wrong.
I do appologise to the group for my language. Most who know me
will probably understand this.

> Your postings were targetted towards me,
Absolutley CORRECT. Spot on. 100%. For the first time in these threads
youv'e typed something factuall.

> why you needed to use abusive language in the first place is something
only you know.

Because _I_ choose to. The same way as you choose to be abusive.
Maybee different kinds of words but equally abusive.

> I assumed this kind of language comes natural... anyway,
> if you think I'm going to step down to the same level, you're wrong.
Not at all. I very rarely sware in public, in your case i have made an
exception
as i believe this is the only way to treat you.
Anyway, why single me out for abusive language. Do you remember "HAPPY"
who really got some stick of SWEET.

> >I have read the groups for many years and i find it difficult to believe

I agree they have been aired before. So why do you choose to follow a
certain
poster around like a bad smell instead of letting the legal action run it
course.
For all we know you could be a pauper who couldn't care about being sued.

> You must think it's full of idiots here...
Not at all. You would do well to remember that a heck of a lot of the
contributors here have been my customers aswell. I have respect for them
as many (probably untill now) have respect for me whilst i was running TUS.
But, i am accused of being "The Ultimate Scam".

>You know very well that everyone
> here will ask and even plea to stop this thread.
This is a really cheeky comment (profanaties removed on re write).
Who are the instegators each time? Please answer this one truthfully?

> >As you are probably aware Barrie used to help out on my stand at
> >the shows and is competent at repairing ST's. I have passed on many
> >of my former customers to him over the past year as i now develop

Pardon me. Have you missed many threads?. I would rethink that statement if
i where you. Remember "FETTLER" (or some word like it).

> And no one is questioning
> TUS either for that matter, why do you feel you have to defend yourself?
Veloce 020, Mega STE, Mr Lai.
Once again many insinuations (nearly) from certain users. Unfortunatley
for you guys this one was down to me. Mr Sweet has spread the rumor
around (before Sweet responds to this "i'm not interested in what you
say on this point so i will not respond to you") and tried to use it againts
Keychange. He invited me into the afray and i am simply responding to it.

> would i really put my trust in Barrie if i thought he was going to swindle
> >them.
> Probably not, but how can you possibly know someone his real intentions?
no
> one claims Barrie swindled certain customers *willingly*. I know very well

> and fellow collegue, but the methods used will not give you much
supporters
> for the case I'm afraid, it should be pretty clear by now that using
abusive
> language to get your points across, has a negative effect here?
Oh Dear, you really don't like name calling "DO YOU".
Yes i will stand up and cause you offence as you do to others.
I have watched this develop for over six months and kept quiet.
You have tried to court user opinion and to what end?
Whats wrong?
Don't you like the idea of another person posting against you
in an agressive manner? I am simply evening up the numbers.

> reasons I stepped in was because of the abusive language being used
against
> some of the people here in the first place....
Answer the question. Who started the abusive postings all those months ago?

> >The customer from hell always comes along at the wrong time and some are
> >hell bent on causing as much trouble as possible if they don't get their
> >way. I will be the first to admit that not every job went well and i took

Oh MY. We agree on something.

> Certain deals are bound to turn "sour" from time to time.
> But again... no one is questioning this either.
Really?

> The way in which this deals
> are handled are important, Barrie may be very competent, but when it comes
> down to public relations...
Yet another detrimental comment. Have _you_ ever dealt with Barrie?
You now claim to have 4 cases, you claim this, you claim that. I am fed up
with what you claim. I also believe that the group is quite fed up
which is why i have decided to post back against you. You may not like
my abuse but in your own words "I will not loose any sleep over it".

> >Sean's hard drive.

> admitted)
I should not really say this but what the heck. A fraction of what? A
fraction
of the SRP of the individual component or a fraction of the overall cost
of the device? Did you ever look at it from a suppliers point of view.
BTW was the refund made? Did the customer accept the refund?

> >Alleged Replacement of Superior Parts.

Please do not insult my nor the groups intelligence (spelling on my behalf -
maybee).
You well know that Sweet has mad representation on this point from the start
and i will
not be goaded by you. Why don't you ask before making more stupid comments.

>
> >What i would advise anyone who wishes to know should contact Mr Lai who
> >would appear to have spread the story and has since tried to retract it.
> Not even mentioning the fact that it isn't very polite to put someone in a
> dark spot while he's unaware of it and not able to defend himself....
Why don't you at leat check what you type. You are being very very ignorant.

He is very aware of it so why don't you ask him? As i said earlier Sweet implied,
and i reacted.

> This is what you're playing at.... you don't really give a toss about the
> Keychange soap story, you've got some personal beef with Mr. Lai and want
> to involve the newsgroup, nearly all your postings have carried some hints.
No. I am not _playing_ at anything. As i have shown to Mr Lai.
However i would like to know what game you are playing?
In business you do not play. You either defend yourself or people like you will
destroy all your hard work with a few words. Untill February of this year i have
never had any dealings with Mr Lai but he chose to use my product and customer
in an allegation against Barrie. This is substiantiated by Sweet's postings (intent
has been proven). I wonder if Mr Lai would like to set this matter straight in the
group before it esculates to my original intent.

> If something is bothering you, why don't you just throw it out in the open?
See above.
You will never goad me into your pathatic web. I will always try and
rise above your comments as i have done for 6 months.
What i will ask is "Do you also have a problem with TUS ?"
A couple of days ago you called it "The Ultimate Scam".
Do you wish to try and undermine my reputation?
I will admit to using offensive language to get your atention but if
you wish to accuse me of anything then lets hear it.

> >Any spelling mistakes are not deliberate. Grade 5 CSE you see.
> >Ah well, we can't all be perfect can we Dennis and Steve.
> You conveniently seem to forget that English is not my native language,
> meaning that my postings are bound to carry some spelling errors and that
> some of the sentences will be build up rather awkward, so what?
Exactley, so what?
You and Steve have embraked on the escapade. All i am asking you to do
is justify it.

> >BTW Should i start spreading stories about the MOST reputable of
> >UK based Atari dealers into the group. I can certainly tell a few,
> >i know because i fixed them after they stuffed up.
> Does it make any difference if anyone would ask you not to?
If this is the way you feel than justify your own actions?
How many members of the group asked you to do this?

> it seems to me that you're going to carry on anyway....

Yes i will carry on posting. Your side kick involved me. Don't
you like another party posting against you. For a devout European
you certainly are one sided. BTW my abuse is only a different style
of your own. If you don't like it then tough.
Are we using double standards again. Do i remember a thread a few months
ago where someone defended Mr Sweets abrupt manner and language. Whats
good for the goose is good for the gander (I think i got that one right - it
is
quarter to five in the morning)

As i have stated before. Two people are destroying this group. You are
a small community who should enjoy the platform and the friendships it
brings. Many of you know that it is not my nature to be abusive but
now and again you have to say enough is enough and i am going to give as
good as others get. BTW I have put myself on the line to defend a good
person, It is plain to see the insinuations that have been made to myslef
because i have done this. I tried by private email but to no avail.

I hope the group will make an informed decision and i do appologise
for my abuse but believe me sometimes you fight fire with fire.

All the best for the future.

Dave

Just the same way as you have been spreading rumour.
You and your side kick involved me, every action has a reaction.
You are twisting the truth to suite yourself.

I could type all evening but i happen to enjoy the group so i won't. This is
more
than i can say for yourself or Sweet.

I bet you didn't expect someone to defend Barrie in such a vigarous manner?
As i have said before i know because "I was there" WHERE YOU?

You have made some very nasty allegations against Barrie. You should
backup your arguments with fact instead of speculative words. I care what
my customers think about my business and

Hi Janez and everyone.
Yea ,I is/was a "REAL" diehard Atarian till recently. I have used Atari in my office since the 8-bit days.
But real time interactive internet just became too necessary. I tried CAB but System Solutions turned me off so completely that even windows began to look good!
So now I use Gemulator 2000 on a pentium laptop with win95.
I still use my Gem/TOS software for business but can fax/email/browse while I'm doing it.
Am a a "REAL" Atarian? who knows
Do I miss the elegance and reliability? sure
Do I dream of a "NEW" Atari ? sure
Would I pay mega bucks for one? probably not

Am I a "REAL" Atarian? who knows

adds
> of now defunct dealers.
> What's so difficult in calling a horse a horse?
>
When the Ass is calling it.

No. Wrong again. I have never claimed anything as you imply. For you to
say this shows your arrogance. Yes i spent 10 years in the market. Yes i
sold
many many upgrades, yes i developed most of the parts i sold
in my business. Did i ever claim to be world famous? NO. Did i ever go
beyond my station? NO.
You are the person attacking another dealer? Most of the UK guys
know of me?
Maybee the UK guys can now understand why most postings where abrupt
as this is the attitude you get?
Dennis, you can say what ever you want against me. I am proud of what i
did over all them years. I see my products mentioned now and again
and it makes it all worthwile, Hey Trevor - do you agree. As far as i am
concerned Dennis is talking out of his ****. I do not know what mission he
is on but if anyone is nasty to him BEWARE you are insignificant.

> >>I don't wish anything, if you want to make
> >>yourself ridiculous, go ahead and post the pathetic retraction, who

> >A complete arse hole could only make a comment like this. He well knows
> >that the reference is to Shiuming Lai. Care to comment you gutless prick.
> No not really, you seem to answered it already :-)
What, you are a gutless prick?

> I can't really see Shiuming Lai writing pathetic retractions, I don't
> remember seeing any public retractions lately in any of the English Atari
> newsgroups and I can't recall any such threads either.
> Frankly spoken : you asked if I wished to see you post it? YES please ...
> unless I see this with my own eyes I'll assume it's just a figure of your
> imagination.
You may assume whatever you like (and do).
Once again ask Lai. Or am i a liar aswell.
Come on Dennis call me a liar. You and i know what we are on about. Do you like playing games or are you tired with the group and simply wish to destroy it?

> >P.S. Do you want me to email you a few arse licking web sites.
> No, but thanks anyway.
I take it that Steve has already sent them.

> I would strongly advice you not to email me, since the reply could upset
> you somewhat.... heaven knows what might come attached :-)

You may advise whatever you want but i would not take your advice? As you say PROVE IT?

But what could you possibly mean.
Summons? For what?
BTW Please do not post anything containing You and Steve as Beastiallity is an offence here, to be honest i don't really care what comes attached aslong as it's not you.

Do you really wish to f about with ADSL2.

Oh. BTW Anything you attach could never be as big as the chip on your shoulder
or would that be Steve trying to get a better position.

You and Steve started this, don't balme others for getting involved. Do you really feel a big man sitting behind you little keyboard typing supposedly BIG WORDS.

STeve. Who the F*** is STeve.

Hey - I'm not sore, even a bit sad to be asking myself whether I am "real" or not.
I probably worried more over "switching" than I did about my divorce!
But sure, I won't be buying any new hardware and not much software, (I did buy Uwe Seimet's HD Driver last week even though its published by System Solutions). But in reality I haven't bought much in several years. The only reason I bought HD Driver was so I could format removables for both DOS/TOS. Otherwise I was fine with my old ICD software.
Don't get me wrong, I applaud all you guys and gals who support the platform and wish you all years of happy Atari-ing.

Hi,

I also have a Falcon030, TT030, Mega STE, Mega ST2, 1040ST, 520ST, 260ST and more, but I am new to MiNT, just downloaded and burned the Debian.iso and gonna play with that, also bought 2 bionet-100 adapters for networking. I like join this project and I can help with:

1) Burn cd's for distribution
2) Maybe put-up an FTP server mirror when needed.
3) Make English to Dutch translations, or otherwise.
4) Helping to write doc's.
5) Testing it on several different Atari systems, non-modified.
6) Helping with Idea's to make the installation so that more newbies can install MiNT

I meet DRACO at Error in Line #2 and e showed me MiNT on a Falcon030 in a TT-case. It did look great to me, that's why I gonna start with MiNT.

Gtx,
TXG

Hi guys, actually you don't need the extra hd detect line on the MegaSTE.
Don't know why but it just works as a HD drive. I suspect if it can' read
the disk it just kicks up to 16 Mhz? Both of my megas work fine with my
external hd drive, which is just a dd external with the mechinism replaced.
Also worked on my old MegaSTE as well. 3 out of 3;-).
Whats the Falcon drive 2 thing, Lyndon? Very interested. Will be in NZ
(going home) let me know how you go.

Regards

Mark

Apparently it is very "dirty", Mint isnt an AES tho;-) eh Henk. It will make
the system a little dicey. As per the Sparemint doco's. Should be the same
under Magic I expect?

It works here for the most part, but behaves strangely.
After the computer runs for some hours, and I start and exit
apps which use wdialog, eventually they start refusing to run.
Actually crashing and issuing a msg in the console.
If I rerun wdialog from the desktop they magically work again.
This is happening with CAB and QED and I suspect PhotoTip
might react the same.

Axel Gehringer of AG Computerteknik in Germany still has various
models. If you don't write fluent German, you might have some
troubles getting good service, though...

He apparently has a web site, but I have yet to see it.

Another alternative is Mario Becroft's Galaxy VME graphics card
which has a built-in Ethernet solution. Drivers for the network
part of the card are still being written but, knowing Mario, it
shouldn't take too long before that is completed. More info:

Hi Sean,

>No, but I don't feel I have said anything unfair and have tried to
>keep to the issue which Barrie requested i.e. previous cutomers
>to come forward and I have put my point over clearly enough I think.
Don't be intimidated...
Dave is just doing the "honourable" thing, standing up for a fellow
collegue and mate. Since he finds it a bit difficult to get his point
across he decided to drag you into the discussion...

>> a Kangaroo court. All i want Dennis to do is answer my
>> questions put to him in previous postings.
>
>Can't comment on this as I have not kept up with newsgroups (or
>computing) for a some while now due to time restrictions at present.
Nothing much happened really... apart from the usual verbal abuse coming
from Keychange. And now Dave stepped in and is blowing things out of
proportion because he hasn't got a clue or is misleaded by Barrie.

Short resumee:
After the posting in which you describe how Keychange sold your LINK
without your consent and then only refunding you partially and then
seeing the buckets full of abuse and slander you received from Barrie,
it was time to do something about it: Barrie publicly admitted that he
sold your LINK without your consent and seems to think everything is OK
since he payed you back a fraction of the real value... various posters
here asked Barrie to elaborate on this, but he choose to ignore them.
So I publicly called him a thief, crook and swindler... :-) since he
claims to keep records of all his dealings it should be fairly easy to
proof that you are a liar and that you have given him consent... after
all, that's what he wanted you to produce all the time, why he wanted you
to provide proof when he got all the records, is something only he knows.

This happened some six weeks ago in CSAST-tech, his only reaction was
that he would take me to court, but so far he didn't even try to proof
that what was said is untrue... apart from the usual abuse and slander
ofcourse, but I'm used to this coming from keychange.
Oh yes, I also called him a pirate and accused him of undermining our
platform since he spreads illegal commercial harddisk drivers of ICD
and by doing this hurts the sales of the only supported harddiskdriver
left.... yep, you guessed right... no comments either, apart for the
usual slander ofcourse

Well that sums it up somewhat....

As "for taking the piss out of you"... Dave must have a very special newsreader, AFAIK no one here even mentioned or hinted at you and your unfortunate dealings with Keychange. All that needed to be said about it was done so, there was no need to comment on it again. Although you were called a liar, have been slandered and got a bucket full of sh*t poured over your head, me and a lot of other people here feel you are the "moral" winner of that particular "discussion".

Correction: Dave and Barrie several times "took the piss out of you", but this wil be denied ofcourse and blamed on my newsreader while crying out loud that I'm a liar....

Cheers from Belgium

Hi Mark

> Whats the Falcon drive 2 thing, Lyndon? Very interested. Will be in NZ
>(going home) let me know how you go.

OK so I tried it and my design worked, but the only side fect was the light stayed on on drive B. This was due to the WD not expecting a drive to beselected and so it pulled some lines low or high. It did however read the disk fine and when you access the drive A the drive B light went off. There is a way to stop this but not many want two floppys these days so I'm not going into it. Basically Mark, you take the DS0 line and invert it with a NAND or NOR to the DS1 line. I mounted this onto the drive B floppy.

> like join this project and I can help with:

Okey some hints :) i hope u wont get angry:

Debian is ok for testing purposes but its still far from usable, there
is basic Debian package, which installs okey, but still not usable and and
deb installer has some probs, also u need to prepare ext2 (minix not
prefered) partition manualy.. For ppl not used to cli etc, may be big
prob.

Sparemint on other hand has rpm installer, which works ok, but has no
basic package so, u have to make minix/ext2 (better) partitons, install
basic comands, create directory tree and install rpm... Again no big
deal, but prolly very confusing for ppl not used to cli (comand line
interpeter)

KGMD is complete package, relatively easy to install BUT needs some
fixing, again need some cli fiddling but atleast basic system, users and
so on are already created! After KGMD is installed u need to rearange old
directory tree, copy or remove some files.. and install rpm (to be able to
install sparemint packages). This is in my opinion best way to do it.. If
u are unix newbie u can be prepared to some trubles, even reinstalling,
but believe me, MiNT as perfect blend of Unix and GEM world will make u
happy!!! MiNT does ope new horizonts to Ataris..

Another note: KGMD claims 50mb is enough for MiNT (unix), but do NOT
install it on 50mb partiton.. Optimal size is 200mb+. because u will make
accounts and each user can have own space, u will also install new
packages etc, so do not be shy with space :) And full MiNT OS
(unix+AES) will require 14mb as minimum...

All above goes for full MiNT OS instalations, that means Unix virtual
consoles (up to 9) and AES, which can be ran at same time... Even more,
there is now XGem server, which allows to run Xwindows apps in GEM
window! That means u can run GEM and Xwindows apps at same time, Xapps
also from remote! (actual app, let say Netscape is running on remote
machine, some unix box, but output (gfx, windows) are redirected to your
machine)

Incase u just want multitasking desktop, u can MUCH easier install MiNT kernel only + N.AES + desktop (preferably Thing)....

> 6) Helping with Idea's to make the installation so that more newbies can
> install MiNT

I will sound strange now:

I prefer ppl install KGMD with minor probs ;) That way they will also get good basics anout cli and unix and in future the will be much more capable of fixing some mess they will do, and of course make less mess etc.. hope u know what i meant... And in reality, difficulty of MiNT instalation is in 99% a myth really... :)

>
> I meet DRACO at Error in Line #2 and e showed me MiNT on a Falcon030 in a
> TT-case. It did look great to me, that's why I gonna start with MiNT.

EIL was really nice, i enjoyed it a lot!

> reason they switched to the PC was not because of the software, but
> because of the computer being behind the times. To each his own...

As i said i dont mean to judge ppl's devotion to Atari, still to sell
all off tells us something, ppl use emulators mainly from nostalgia
reasons, cause they did mistake and sell machines.. Also, when i check
emulation pages, there is TONS of barely, if at all, legal software, old
games which still are copyrighted etc.. maybe 1% of emulator ppl use it
for doing something for scene.. To be clear, i mean on ppl exclusivlely
with emulators.. And i personaly know some, which were using MagicMAC.. ad
noone ever bought something etc ... Atari as platform will not benefit
from that... There is c64 scene and 8bit Atari scene still alive, new
prods out, but none of these scenes didnt benefit a bit with
emulators. They did benefit from fanatics, which still produce hardware
extensions and odd devices for those machines.

Hi Dave, do sit down,

>Remember "FETTLER" (or some word like it).

That was a phrase that barrie Lamb-chops introduced, he called himself
an Atari fettler, he even had it on his web page. "Atari fettlers to the
music industry" was the phrase as i recall.

I would suggest that rather than deleting them he should rename
them from the desktop to - say - *.RSX. That way it is faster to
restore them afterwards.

>DS0 = drive A and DS1 = drive B

Yes, This I know. But I do not have a switch for this on the new Sony 1.4HD,
Unless it would be located inside the Drive Mech Case.

And since it is a new drive, I would think that it would already be configured
as Drive 1, since most PCs only come with 1 HD Drive for along time now.

I'll check inside the mech case for DS0/DS1 jumper/switch or whatever.

>

Right, I really don't need a 2nd Floppy drive on the Falcons.
Just going to replace the missing drive on a Falcon mother board that I'm
fixing up.

>>Also wanted to install a 1.4meg drive mech into a GoldenImage DD drive to
>>use as a 2nd HD drive on my MegaSTE. If this Sony can be modified to do so

>mode) and possibly some simple logic involving the disk select lines.

I don't think all that is needed to setup a 1.4HD drive mech into a external
DD drive unless the MegaSTE was a early one with the internal 720K DD drive.
Mine has TOS 2.06 and the Internal 1.4HD Floppy Drive and Internal Hard Drive.

I hooked up a GoldenImage 720K DD external drive to the MegaSTE and it did
try to read it as HD at first, then it adjusted down to DD. It will be nicer
to have a working external HD drive on the MegaSTE for file/disk copying
and etc.

Does anyone know if a External 1.4HD drive was ever made for the Ataris?

Good! I thought that it may work like that.

There was talk about setting up a 2nd Floppy drive on the Falcon in this Group along time ago. I'll have to search my Archives and see if I can dig up some more info on this. Although I don't really need a 2nd one, it would be nice to know how to do it correctly on the Falcon.

IIRC, there was also some talk of using 120meg drives and the like on the Falcon as either a replacement for Drive 1 or maybe as a Drive 2.
Did anyone ever try any other type of Drives on the Falcon?

I'm not at all. I was just surprised to see Dave getting involved in such a
way TBH.

> Dave is just doing the "honourable" thing, standing up for a fellow
> collegue and mate.

I can understand this, however misguided.

> now Dave stepped in and is blowing things out of
> proportion because he hasn't got a clue or is misleaded by Barrie.
>
^^^^^^^^
From what I read recently this _must_ be the case or he wouldn't have said
the things he did.

> Short resumee:
> After the posting in which you describe how Keychange sold your LINK
> without your consent and then only refunding you partially and then
> seeing the buckets full of abuse and slander you received from Barrie,

No different then from the reaction I received at that time then - shame.

> sold your LINK without your consent....
> here asked Barrie to elaborate on this, but he choose to ignore them.

Ditto then...

> since he claims to keep records of all his dealings it should be fairly
easy to
> proof that you are a liar and that you have given him consent... after
> all, that's what he wanted you to produce all the time, why he wanted you
> to provide proof when he got all the records, is something only he knows.

Because he knows that he's in the wrong but chooses to convieniently ignore
it. Plus from what he's written previously it's obvious that either he
never kept any or only partially kept some - given the total inaccuracies
or omissions in his story but that has been said before and there's no need
for me to go over all this again.

> Although you were called a liar, have been slandered and got a bucket
full of

Hopefully people who know and have had dealing with me will vouch for my ch
aracter. I would have liked to think Dave would have done too seeing I had
dealings previously with him too......

Thankyou for the update Dennis. :-)

Best Wishes
Sean

6384. POV-Ray 3.1g Benchmark...

Newsgroup: comp.sys.atari.st
Date: 2001-05-20 03:16:31 UTC
From: J Wilkinson <jwandjw@ihug.co.nz>
Message-ID: <3B07370D.B1716530@ihug.co.nz>
Source record: 46070

Hi there,

A benchmark on a some website somewhere (?) gives a POV-Ray benchmark for different CPU's. I thought I would give it a spin on my Falcon, but the results were VERY disappointing!

The command line is...

+A +Ifish13.pov +Ofish.tga +W720 +H486 +L(include path etc...)

If you use the Archimedium 030+882 version of POV 3.1g (gcc) it takes over 70 hours, and equates as slower than a bloody 386DX33. The 386 does 8 pixels/sec average and my Falcon is less than 1.5 pixels/sec! What the hell is wrong here!! I was led to believe that a 030/882 combo would be clock equivalent in float math to a 486DX, yet this is NOT true obviously. Can anyone else give me some light on this? Does a PureC compile work faster perhaps?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

PS. A Silicon Graphics machine I am looking at on ebay is about 800 times faster than my Falcon with this benchmark, for little more than about US $400!

I never realised you sold it TBH! I thought it was Fast Club only. Do
you have the upgrade from v4 to the last version ever made?

This is an interesing attitude of some developers. It seems that there is
an almost universal consensus that WDIALOG is a bad piece of software.
Yet, new applications continue to use it. As a lot of other, quite good
applications do not use WDIALOG, obviously it is not indispensable and these
extensions can be obtained in other ways. WDIALOG is not a standard.
Why can't they let WDIALOG go into history with other utilities which
caused too much compatibility problems?

Hi Janez,

Yes I will agree with you there about there being people who have not
bought anything, but received their programs through piracy. It is
unfortunate, but true. Still, nowadays, when anyone talks about using
an Atari computer/emulator and running Atari programs, I get real
excited about it.

Hi all,

I tried out the new version of PhotoTip and boy is it great. I am using
version 2.12, so using 3.0 is a real dream. Lots of nice new features.
The only drawback is that there is no English manual, but using it is
straight forward. Since I am a registered user, it will only cost me
$10 for the upgraded key. Download the demoversion at the site below:

http://home.sunrise.ch/dursoft/progs_e.html

Do you read A-ONE? If not, then you know nothing about what you're asking. A-ONE has never been "just" about Atari-related news. Check out an issue and you'll see what it's all about.

Hi,

> A benchmark on a some website somewhere (?) gives a POV-Ray
> benchmark for different CPU's. I thought I would give it a
> spin on my Falcon, but the results were VERY disappointing!

1st, benchmarks are NEVER adequate! Falcon WILL perform bad on any standard test, i mean bad compared to enormous raw CPU power machines have today, but on ct2 Falcon play mp3 slicker than my pals G3 mac, etc etc. Falcon is VERY weird machine and thats why i love it so much :)

Can u tell me any other machine to perform as APEX does, like CAF does, like Falcamp does (+ many others) on plain 16mhz?? BE proud, not disapointed! (i realy realy realy suggest u watch latest EIL" winner demo named "hmmm" all in there is REALTIME and Amigas need 060 for similar results (better) and Pcs need 3d card!! Falcon is hapy with 4mb and 16mhz!! Im proud to have such machine and that we have such genious coders!!)

Then again, gcc and windoze/macos apps are NOT optimizied at all, those guys have no clue what optimzation is, for them optimization means "go and buy athlon" and that makes another prob for our good old 030 :) Fine example of that are Falcamp (ppl said its impossible) or great Nocrews mp2 player which takes less as 1% cpu on plain Falcon, and their latest replayer tooks LESS time with mp2 as DSP MOD replayers! To be better, at rates above 160kb/s mp2 sounds better as mp2 while filesizes are same aproximately...

> +A +Ifish13.pov +Ofish.tga +W720 +H486 +L(include path etc...)
>
> If you use the Archimedium 030+882 version of POV 3.1g (gcc)
> it takes over 70 hours, and equates as slower than a bloody
> 386DX33. The 386 does 8 pixels/sec average and my Falcon is
> less than 1.5 pixels/sec! What the hell is wrong here!! I was
> led to believe that a 030/882 combo would be clock equivalent
> in float math to a 486DX, yet this is NOT true obviously. Can
> anyone else give me some light on this? Does a PureC compile
> work faster perhaps?

Imho whats wrong is that u compare CPU's rather than machines.. 030 is actualy in terms of CPU power opponent to 386 (if we can look that way) and 486 FPU unit is quite good actualy! U should look on machine as integrated machine... FPU stuff will work better on 486, but mp3's can play on plain falcy etc... Also Photline was compared to Photoshop on 486/100 and author of test (Photoshop user) said they are aproximately equal speed...

Povray itself do not make Falcon bad, esp since whole machine is imho a lot more usable as 386, 486 even... Also u mention an 33mhz 386... so double clock and raytrace is task which mainly rely on CPU clock. OK it also depends how many instructions CPU does in one cycle etc.. stil 030/386 are CPU's from same era.. And i think Intel's FPU wasnt bad compared to 882 at all...

Also i think your version of Povray is slow. My version of Povray 3.1 completed the task in 3h 56mins on ct2, which makes it 25pixels per second Also i need to mention that i render that pic in MiNT, while i used computer normaly as ever, which means i had 3 vcons opened, and ircing in one, did some ftping and mail/news reading reply in other, on AES i did browse some pages, even play some mp2 files etc.. also had some idle time, cause of TV watching.. so that time could be considerably lower as well. If u divide my time with factor 3 maybe 4, u can get time it would be needed on plain Falcon, but that proly is not totaly correct value...

Bottom line: U have slow version of Povray, and Falcon is NOT raytracing station :) Also it is not 68030 ONLY machine, but a Falcon :) (u can not do, i dont mean u can do it slow, but can NOT do,certain things on 386, but u can do easily on Falcon.. opposite that rule doesnt apply :)))

> PS. A Silicon Graphics machine I am looking at on ebay is
> about 800 times faster than my Falcon with this benchmark, for
> little more than about US $400!

What can i say, Falcon is not GFX station. Sell it, get SGI

>>You must think it's full of idiots here...
>Not at all. You would do well to remember that a heck of a lot of the
>contributors here have been my customers aswell. I have respect for them
>as many (probably untill now) have respect for me whilst i was running
>TUS.
Keep on posting like this and see how the respect you've build up over the years, will melt away like snow under the sun...
You've got a very original way to show the respect you have towards your former customers and contributers here, to say the least...

>> I assumed this kind of language comes natural... anyway,
>> if you think I'm going to step down to the same level, you're wrong.
>Not at all. I very rarely sware in public, in your case i have made an
>exception as i believe this is the only way to treat you.
Well then keep on swaring in public, and believe whatever suits you, how do you put believing and swaring together BTW?

>I agree they have been aired before. So why do you choose to follow a
>certain poster around like a bad smell instead of letting the legal action
>run it course.
Why I choose to defend myself against Barrie his abuse should be crystal clear if you read the relevant threads... legal action will never run it course if Barrie has to set it in motion. After six weeks we haven't made one single step progress.

>For all we know you could be a pauper who couldn't care about being sued.
Cherish the thought....

>But, i am accused of being "The Ultimate Scam".
You must have lost a lot of sleep over this the last week... you keep bringing it up. Taking this out of it's perspective and conveniently forget to add how it came about, action is always followed by reaction, if you don't like the reaction you should refrain from taking action. You thrown a pie, I threw one back...

>>You know very well that everyone
>> here will ask and even plea to stop this thread.
>This is a really cheeky comment (profanaties removed on re write).
>Who are the instegators each time? Please answer this one truthfully?
Thruthfully? are you sure?
You are the instegator of this thread, what's even more, you're doing all you possibly can to keep it going...

>>it should be pretty clear by now that using abusive language to get your
>>points across, has a negative effect here?
>Oh Dear, you really don't like name calling "DO YOU".
>Yes i will stand up and cause you offence as you do to others.
>I have watched this develop for over six months and kept quiet.
Funny.... I only joined the "discussion" in february, that's some three
months ago.
You're using a very weird newsreader, a newsreader that produces postings
that never have been writen, mixes up dates (maybe a YK2 bug?) and turns
the words written around in a way they suit you...

>Don't you like the idea of another person posting against you in an
>agressive manner? I am simply evening up the numbers.
I told you repeatedly that I don't take any notice of postings written in
that manner, if you really want to post against me and "even" the numbers
you'll have to think of another method... better do it quickly, or you'll
never know if "you get to me". I'm about to filter you away, since most of
your postings contain nothing relevant except for the abuse and swaring.

TBH: I must say this has broadened my knowledge of the English language
quite a bit, so this thread has had a purpose after all.... I suppose I
should thank you...

>Answer the question. Who started the abusive postings all those months
>ago?
The question was why I joined the discussions, I've answered that. Who
started what, why and when isn't relevant...

>You now claim to have 4 cases, you claim this, you claim that. I am fed up
>with what you claim. I also believe that the group is quite fed up
>which is why i have decided to post back against you.
>
Your newsreader seems to be acting up again...., I mentioned, having these
cases *once* to the group, not twice, three times and certainly not all the
time.
You and Barrie for that matter know very well that I will not elaborate on
these cases in public (not in private either), as this is the best way to
loose the trump cards....

>I should not really say this but what the heck. A fraction of what? A
>fraction of the SRP of the individual component or a fraction of the
>overall cost of the device? Did you ever look at it from a suppliers point
>of view.
Nice one this....
Have you ever sold a component or device without a customer his consent? I
would think not. Has the thought even ever occured to you to sell someones
lawfull property? I would think not...
Well that's exactly what your mate did, he seems to think that refunding
the customer for his "loss" makes it allright... If I steal your car and
sell it then that doesn't matter, it's not even important and relevant, as
long as I refund you a fraction of the real costs of the car? everything is
allright?
Strange reasoning... weird morals.... :-/

>>>What i would advise anyone who wishes to know should contact Mr Lai who
>>>would appear to have spread the story and has since tried to retract it.
>>Not even mentioning the fact that it isn't very polite to put someone in
>>a dark spot while he's unaware of it and not able to defend himself....
>Why don't you at leat check what you type. You are being very very
>ignorant. He is very aware of it so why don't you ask him? As i said
>earlier Sweet implied, and i reacted.
I'm asking you, since you're the one making claims about a certain story being spread. I have no knowledge of such a story, I can't find one single posting in which Shiuming Lai spreads anything, and for that matter I can't find any postings in which he retracts or tries to retract anything either. Tell you more, I can't even find one single message in which he comments on the keychange story, he's one of the contributors to this group that has never taken part in any of the discussions concerning this topic.
So, instead of calling me ignorant, show the group how ignorant I am. Post the offending messages, or at least give their ID-number...

>What i will ask is "Do you also have a problem with TUS ?"
>A couple of days ago you called it "The Ultimate Scam".~
NO, I do not have a problem with TUS, as for "The Ultimate Scam" bit, this was a reaction to your action, if you don't like it, well then refrain from action....

>Do you wish to try and undermine my reputation?
Not at all, but seeing the way you are carrying on in here, I have the impression that you're undermining everything you stand for and build up over the years yourself... If you think that's worth it, carry on.

>I will admit to using offensive language to get your atention but if
>you wish to accuse me of anything then lets hear it.
You would have got a lot more of my attention without the abusive bits. As for wanting to accuse you of anything... I told you repeatedly that until a week ago I never even heard of you. So no, I do not accuse you of anything, I have no knowledge of anything to accuse you with and even if I had anything, I do not have any motives to accuse you anyway.
Is this what you wanted to hear?

There's more in life then accusing people of wrongdoings, you seem to think I enjoy doing this... think whatever you like, it's quite nice outside, time to take the dog for a walk and a visit to the local pub...

Cheers from Belgium
Dennis

The only one disreputing himself are you... I'm not the one accusing a
certain uk online magazine printing rubbish, and I'm not the one who's
insinuating that Mr. Shiuming Lai wrote a non-existing retraction, I'm
not the one threatening with actions being taken either...
After all your hard work *nobody* here has jumped on your wagon, nobody
noticed an article that damages your business, yourself or reputation in
any way, on top of this nobody here even supports your silly statements...
even Barrie doesn't (publicly) support you, how's that for loyalty?

TO ALL MEMBERS OF THE GROUP.
I think a public apology to Mr.Shiuming Lai is called for here!!

You don't even have the guts to tell the group what it's all about, except
for some very vague insinuations that probably only exist somewhere in the
back of you head you haven't scored one single point, and you accuse me of
disreputing you and having no clue? wake up!!

This time I am ROTFL, please continue posting more hilarious stuff.

Cheers from Belgium
Dennis

Source record: 46102

From: "Barrie at Atarispares" <barrie@keychange.co.uk>
Date: Fri, 18 May 2001 11:07:42 +0100

>> Really? Well, then we simply must do something about this.
>> When I mailed you my private credentials ...
>
>After all the lies you've told do you think I believe you would send a
>genuine address?
Nice try Barrie, you publicly challenged me to sent my address, adding
that I wouldn't have the guts.... remember? now that I did you publicly
doubt that I sent you the genuine one. What do you think I sent you ?
Donald Ducks address?

I have had many snailmail contacts with people in this group, they all know
my address:
Dennis Vermeire, G. Mercatorstreet 13, B9000 GHENT, Belgium

You see Barrie, unlike you, I've got nothing to hide, if this adress is a
fake, someone is bound to reply, right? Since according to your pathetic
crying here you've got nothing to hide either, publish your address also,
and this time publicly please, a business which is afraid of handing it's
address, sounds *veeeeery* fishy to me...

Wait I have a better idea: does anyone here have the Keychange address? if
so please post it or mail it to me, the sooner I can get the crook before
a judge the better....

>I'll wait until the court orders your ISP to reveal it, same for your
>friend sweat.
That's the wrong approach Barrie, this will lead to nowhere, and only let
the proceedings drag on. What ISP? certainly not GMX, they don't even have
my address... and the newsserver "zonnet" is a anonymous server.
You've got my telephone number also, just give me a call and listen to
what is being said on the answering machine....
Still think it's all fake? :-)

>Explain how you can speed things up,
Ask your sollicitor... isn't he supposed to be the specialist? (and please
don't reply that sollicitor is with one "l", it's not relevant at all)

>you libelled me several times so I have to sue you.
Ofcourse I did, it was the only way to get you into motion. As for libel,
you'll have to proof that... it's libel if the allegations and accusations
are fake and fabricated. It's the whole thruth and nothing but the thruth
when this "libel" happens to be true. Agree?
BTW: the knife cuts both ways. You've outdone yourself also at the slander

and libel bits, I hope you can proof *all* allegations made against me?

>You could always post all the alleged documented evidence
That's what you really would like me to do, wouldn't you? you must think
that I was born yesterday....

Cheers from Belgium

Date: Sat, 19 May 2001 06:14:00 +0100

>>That's your personal opinion. But then that's worth nothing, someone
>>far more qualified will consider the cases and decide how strong they
>>are.
>>
>Yes Dennis. That is my personal opinion. I am not qualified but are you?
>As i said earlier for all i know or care you could be a pauper.
Read it again.... "someone far more qualified..."
And as for being a pauper, what if I am? even if I would be the greatest
one that has ever walked on the face of this planet? it doesn't change
anything to the facts... trying to move the topic and focusing on me,
doesn't cut wood, it's the oldest trick in the book... surely you can do
better then that?

>>Ofcourse I wasn't there, since when does one need to be present at the
>>place of a crime? wouldn't this make me an accomplice?
>Oh so it's now a crime? Are you qualified to judge this?
>Are you implicating me in any wrong doing?
Keychange has *committed* several unlawfull actions... these will be shown
to, presented and proven in a court of law.
Anyone being present at a place where a crime takes place or is about to
take place without trying to prevent it, alarming the official bodies or
in the worst scenario coorporates, legally is an accomplice....
One can ofcourse be present at a place where a crime is commited and be
unaware of it, this however has to be proven....
You publicly told us *several* times that you where there *all* the time.
Hey, I didn't make the laws...

>No. Wrong again. I have never claimed anything as you imply. For you to
>say this shows your arrogance. Yes i spent 10 years in the market. Yes i
>sold many many upgrades, yes i developed most of the parts i sold
>in my business. Did i ever claim to be world famous? NO. Did i ever go
>beyond my station? NO.
>You are the person attacking another dealer? Most of the UK guys
>know of me?
OK, you didn't claim to be world famous, but you do seem to take it for
granted that *everyone here* knows who you are....
Well, maccdave@btinternet.com, I for one didn't have a clue, after a
couple of postings I realised who you were and what you stand for, but
only because you told us so...

>Dennis, you can say what ever you want against me. I am proud of what i
>did over all them years. I see my products mentioned now and again

>and it makes it all worthwile
When and where have I even mentioned one of your products? When and where have I written something that put your products in the spotlight? I put it to you that I *never* named, hinted at and/or insinuated anything at al about your products.
Tell the group where they can find these "alleged" postings, or better yet post them...

>>Frankly spoken : you asked if I wished to see you post it? YES please
>>unless I see this with my own eyes I'll assume it's just a figure of
>>your imagination.
>You may assume whatever you like (and do).
>Once again ask Lai. Or am i a liar aswell.
You claimed publicly that you've got a retraction from Mr. Shiuming Lai and asked I if wished you to posted it publicly, agree?
You've challenged me publicly, I took it on, and *now* you chickened out, the group will certainly remember this one.
Hey, it's your reputation that's on the line, not mine :-)
Post the retraction, explain us what it's all about or just keep your trap shut. While you're at it, post the bits where I put your products in a bad light also.

>Come on Dennis call me a liar. You and i know what we are on about. Do
>you like playing games or are you tired with the group and simply wish to
>destroy it?
I certainly know what I`m on about, I'm not so sure about you though. Your nice story about coming here to support Barrie makes my heart bleed, but I don't believe a word of it. You want the skin of Shiuming Lai, Steve Sweet and Mr.Ardez.... who ever that may be. I'm following this group for years and I really can't recall someone calling Ardez posting here...

>You and Steve started this, don't balme others for getting involved. Do
>you really feel a big man sitting behind you little keyboard typing
>supposedly BIG WORDS.
LOL....
Steve hasn't got anything to do with this thread.... I replied to Barrie his posting, merely informing that MegaSTE/TT keyboards could be obtained cheaper and with an *English* keyboard layout from somewhere else. As for the weblink being out of date.... I did supply an email adress as well, but this was conveniently overlooked.

Cheers from Belgium
Dennis

quite simple - "a fanatic is one who redoubles his effort when he has forgotten his aim" - George Santayana.

Quite simply, The iDiot Forever Known As Sinclap is determined to make an irritant of himself while not realizing that his attempts to disrupt the newsgroups have only shown him up for the total moron he really is - indeed, even the guys in mac.advocacy have now recognized him to be a complete embarassment to the Mac cause. But, what else would you think of a guy who, when losing an argument, resorts to try to change the subject by attacking an entire country, whose "predictions" have blown up in his face, and has been caught telling huge lies and making up "fact" out of whole cloth? Indeed, the elephantine gaffes he's made in boasting about the "superior" Mac are enough for any agency to suggest he be sent to a mental institution for industrial-strength shock treatment....

It is *entirely untrue* that Barrie does not make it clear that the keyboards are spanish. When I enquired on my replacement keyboard from him he made this *abundantly clear*. He also stated that he had already rearranged the keys provided to make them as similar to the english keyboard as possible and that to go further would require replacement from my existing keyboard and advised how this could best be done. The keyboard works perfectly and exactly as described.

I am completely fed up with the vendetta you and Steve are perpetuating based on one problem, whose validity seems to be a matter of conjecture depending on who you chose to believe.

frankly, if I had a choice, I'd be reluctant to use *any* Atari dealer. System Solutions guaranteed me they'd price match when I bought 750quid of computer gear from them. The only item available anywhere else was the monitor and when I located a price that would give me 50 quid off the whle deal they reneged on their promise! Should I blacklist them? (This was when I was writing for Karl's mag and we got stiffed on article payments when they went down). Recently I bought further hardware product from them that didn't work. They're hardly perfect. I could name a multitude of other products from other suppliers too. Would that make you happy?

Dennis - put a sock in it or a get a life. I'm fed up of your noise on this subject (feel free to talk about anything and everything else).

I nearly always use 64k colours. The options I have are 2, 256, 64k and
16 Million. I think this is due to the MILANDRV driver.

>little program GET_REZ4 before I ran the main program.
>

Aha. I ran GET_REZ4 and I was able to get past the resolution
warning but it was then looking for the FONT folder on the C:
partition. I moved SOFTPC to C: I would prefer to have
it on D: but I couldn't work that out.

I then downloaded the FSA archive and the Insignia archive
but I am not sure what the latter is for.

I renamed the file D_DRIVE.HDF and put it on the F: partition.

Now when I run SoftPC I get a menu bar and a black rectangle on
a white screen and the Milan crashes. I tried TOS and Mint.
I think that I now need a copy of DOS and I must try to work
out how to put the SoftPC folder on the D: partition.

Atari SF314 Microfloppy Disk Drive, Double-Sided, Double-Density, for use with all Atari ST Computers.

The SF314 is a double-sided, double -density drive providing up to 720 kilobytes (formatted) of storage on each 3 1/2-inch disk. The drive itself takes up no more desk space than a small book. This drive is in excellent condition and includes the power adapter, interface cable and owner's manual. This drive is in like new condition and ships in the original Atari box. This is an easy way to make disk copies, provides additional online removable storage and to keep floppy flipping to a minimum.

Dave is not "Blowing things out of proportion". I am simply responding
to abuse with abuse. If you don't like it then stop being abusive.

> Short resumee:

> loud that I'm a liar....
Is your special newsreader doing it's job again. All i am saying that IMO
Sean has been conservative with the truth. Is that taking the piss?
I have no intention of intimidating Sean, this is not my style. Nor is it to
use abuse against him. I reserve abuse for people who are abusive.
To prove my point would Sean care to copy my original Email to the
group or at least tell the group the content of it. Sean, was it abusive in
any way, did it try to intimidate you, did i try to stop this esculating
into todays mess?
You see Dennis i am not usually abusive to others, i do not intimidate
to get my own way. I look at both sides berfore forming an opinion.

Are you innocent untill proven guilty by a court of law or
is there another European directive revoking the framework
of justice. Ah yes there must be, Dennis and his Kangaroo court.

I wonder who would want to play the part of be the Judge, i can
already guess the court Jester. BTW Sean don't get upset it's not you.

Just face it Dennis, If you can't take abuse then don't dish it out.

Dave.

PS. Have you ever complained to others about their abusive language or
is it only when directed at YOU. Did YOU stand up for "HAPPY" when
Sweet abused him? Ah, but i don't follow the group do i.
Who the hell do you think "HAPPY" was. What was the email address again
bizboz@whodunnit.freeserve.co.uk, from memory that's pretty close.

I find Imagecopy very useful and I'm looking for an upgrade for my version 4. I really like the layout option for batch production of PCBs, I export from Scooter as an IMG and paste them on an A4 page. Tried this on Publisher and it made a real mess and changed the size ofthe image. As you may have guessed this isn't useful, 0.5mm out and it can be a disaster.

I can't see how Phototip can be a replacement.

I recently found the old ST-Keep BBS program on the net. I remember using this many years ago.

When you run the configuration program it has a place for a registration number - Does anyone out there know what the registration number might be?

I know you can install games as DOORS, but I can't seem to do it. I am guessing unregistered versions do not offer the DOORS feature.

> an Atari computer/emulator and running Atari programs, I get real
> excited about it.

Id like to share that excitement with u, but i dont like emulators, or better how they are used... I also run Speccy, ZX Spectrum emulator,since i had it, neat machine, but i also rebought me a ZX with couple microdrives and Interface1, i also used QL emu and 8 bit Atari emus, since i never have those machines.. And now i have 130XE and 800X and QL on the way... There is no real reason for emulator, since those machines cost next to nothing (same goes for STs for example, iwe got my 3rd Falcon with hdd, 14mb and FPU for 120usd for example) and no emu can recreate the feeling of sitting behind those machines.. A Cray emulator i would understand, big and expensive.. but to emulate Spectrum and ST which gave me so MUCH joy back then in proper days of computing, esp if they cost virtualy nothing is hm like a sin to me :)

Paying 5-10 bucks, give u real machine, 100% compatible, a hand on experience, no need to seek for illegal rom snapshots etc...

Hi all,

> I tried out the new version of PhotoTip and boy is it great. I am using
> version 2.12, so using 3.0 is a real dream. Lots of nice new features.

Im not sharing this excitement about PhotoTip.. I must admit, nice that we have digital camera software!! I love that part... but to replace ImageCopy? I didnt seen any realy good feature which would surpase Imagecopy. Html export is nice feature, but CAB has such module as well. Thumbnails are neat,i admit that as well, ImageCopy's one is a bit shaky but batch processing of ImageCopy is very good, dithering a lot better, it is faster too, printing is very good from ImageCopy, converting is great and it know a lot more formats. Slideshow nicely loads pic while previous pic is displayed and so on.. Also under MiNT it crashes a lot, under Memory Protection wont even start, free pointers warning which is very bad, require wdialog...

This is not meant as crticism, just i saw message that since it allows all as ImageCopy and more, ImageCopy will be removed i felt i need to say something in its defence :)

Forgot another very annoying feature (for me):

PhotoTip wont load without hsmodem drivers.. Since i use TT as server with Riebl drivers and plip for local net (TT is server and Ip masking machine, Falcon is my main machine) i dont use serial drivers at all. So imho PhotoTip could load without and limit that warning for camera dl/ul operations?

Not half as surprised as me. I did say that this would be blown out
of proportion. You two had a difference of opinion over 5 years ago
but instead of putting it down to experience and getting on with life (as
many would), you decided to tell people your side behind closed doors.
A certain user here then spread allegations using YOUR side of the story,
and goaded another, therefore as your side has been used time and time
again to justify their actions then you are in the thick of it.

>
> > Dave is just doing the "honourable" thing, standing up for a fellow
> > collegue and mate.
>
> I can understand this, however misguided.
No Sean, not misguided. I have watched this for over 6 months, i have
had enough (like many others here). Two people always post against
Keychange so i will even up the numbers. Abuse is all they know so i use it.
At least i have first hand experience in what i post, do your mates.
I will also say that if i was still active in the Atari market then i would
still
post these messages. I don't do it for self gratification i do it because
i know how your complaint has been twisted and used to justify their
actions.

>

> aracter. I would have liked to think Dave would have done too seeing I had
> dealings previously with him too......

Exactley Sean, I did have respect for you. I even emailed you at the onset.
You claim to have put it all behind you but obviously you meant
behind closed doors. You decided to spread your side of the story
so take responsibility if others rebute you allegations.
Just because you had previous dealings with me does not give you and

your mates the right to act in the way you have. BTW if you read the group
you will see how i got involved. I will not stand by and allow Sweet to
post gossip about my product, my customer and my business and use
it against Keychange (all be it in a round about way).
BTW Sweet, i don't need to justify this statement so you don't need
to click the reply button. However if you do reply in your usuall abusive
way then you only justify my right to use abuse back. Care to comment
Dennis.
Why dosen't the group take a good look at who started it late last year.

Dave

Everything can be obtained in other ways but non-WDIALOG-apps usually carry
their own GEM lib with them which makes them bigger. Compared to other
shared libs it has the advantage that it's built into MagiC. Since many
applications are programmed for MagiC it's quite obvious that some of them
use WDIALOG's features.

>WDIALOG is not a standard.

Then again, what is a standard? The Atari world is full of "half standards".
In my opinion it should all be put into the operating system eliminating
some auto folder programs like Wdialog.

Greetings,
Matthias

I never asked Barrie to support anything in the same way as he never
asked me to support him. But watch this space. I stayed out of this
untill Sweet posted remarks bringing me into it. You see intent has
been proven in his postings and i am responding.

> TO ALL MEMBERS OF THE GROUP.
> I think a public apology to Mr.Shiuming Lai is called for here!!

Would Mr Lai like to ask me for this apology himself or are you
speaking for him aswell ? BTW Who are you actually
standing up for?

Come on Mr Lai, tell the group. I challenge you, Dennis challenges you
and by now the group will want to know how you spread gossip
and used it against Keychange when you didn't have a clue.

For all your words Dennis i don't see Lai trying to back up his
own words. What's wrong Lai. Lost your ability to type. Are

you incapable of telling the group that you where wrong?

I have decided not to post the allegation here in the same way
as the other parties involved have.
Once again you can goad me all you want
but i will not respond to it with the allegations. All i will say
is call me a liar, cheat, swindler etc etc etc and see the responce.

I will say that Mr Lai is a story teller who got it wrong.

> You don't even have the guts to tell the group what it's all about, except
> for some very vague insinuations that probably only exist somewhere in the
> back of you head you haven't scored one single point, and you accuse me of
> disreputing you and having no clue? wake up!!
>

You should ask Sweet then Lai. Then ask me this one again?
It is not my place to tell the group. Yes it was my product, yes it was
my customer, yes it was my decision. If Dennis is so right and believes
everything Sweet implicates then why dosen't Mr Lai tell the group
how he made allegations against Keychange that were based upon
assumption instead of fact.

Come on Lai, tell the group. I have nothing to hide.

> This time I am ROTFL, please continue posting more hilarious stuff.
I take it then you have not contacted Lai. Thats a shame. Are you
implying that I have made all this up? I don't think you will be ROTFL
for long. Come on Lai tell the group

BTW i am not about to call Lai i liar as you would like me to. His
retraction has been received and that was enough for me untill Sweet
implied it against Keychange in a posting.

Come on Lai, tell the group.

Dave

> but instead of putting it down to experience and getting on with life (as
> many would), you decided to tell people your side behind closed doors.

I did do that - even at the time and have said so in previous postings. I mentioned my experience of keychange as I had had dealings with them. Then when Barrie asked for ppl to come forward here....how is that behind closed doors Dave?

> A certain user here then spread allegations using YOUR side of the story,
> and goaded another, therefore as your side has been used time and time
> again to justify their actions then you are in the thick of it.
>
I don't have any mystical powers over users here if they decide to give their opinions of the dealings I had with Keychange. Barrie has had the same oppertunity to give his account (which he too has done) and as far as I was concerned that was that and I just left it to other ppl here to make up their own minds - finished.

> > I can understand this, however misguided.
> No Sean, not misguided. I have watched this for over 6 months, i have

I've not posted anything against Keychange or TUS in regards to advertising etc. only to postings where I have been brought in for some reason.

> with the truth. Do you have a complaint about that?

You are of course entitled to your own opinion Dave but IMO as you were not there with *all* my dealings with Barrie so how on earth can you know _exactly_ what happened and was said? So from that point of view I feel that the remark was unfair - but that's your point of view so fair enough.

> > No different then from the reaction I received at that time then -
shame.
> In your opinion. How did you act at the time?
>

In retrospect I should have been far more stubborn and not be messed around like I was but basically didin't have enough experience with dealing with this sort of thing and was new to the computing side of the Atari so thought Barrie must have known better......

> And how did you treat the supplier ? Fairly ? We will find out eventually.
>
?? yes, _more_ than fairly.

> > aracter. I would have liked to think Dave would have done too seeing I had
> > dealings previously with him too......
>
> Exactley Sean, I did have respect for you. I even emailed you at the onset.

Dave, I *still* have respect for you and the work you did in the Atari scene and have never said otherwise.
> You claim to have put it all behind you but obviously you meant
> behind closed doors.
I don't understand this Dave, you contacted me *after* the CSAST threads began so things were public knowledge as it were anyway. I gave my point of view and that was that - I've said nothing since only to react to your postings lately. I replyed in a private email to you that I wouldn't disclose our conversation (as requested) and have not posted anything to that fact since.

> You decided to spread your side of the story so take responsibility if others rebute
> you allegations.

As I said the csast thread was active and was prompted to come forward by Barrie's comments to Steve - please check the full threads if you have them Dave. I think you may have accidently got confused over the timing of things here.

> Just because you had previous dealings with me does not give you and
> your mates the right to act in the way you have.

All I've done is come forward when someone was attacked here (Steve) and given my account in full - that's it. I don't know Steve or Dennis personally only through their previous help in this group. It's entirely up to them how they persue a thread and not for me to dictate to anyone what to or not to say. I'm not in some secret group? out to bad mouth Keychange - honestly I have far more important things in life to do.

Regards
Sean

Who really cares if you are more qualified than me? Are you a corporate
Lawyer, how do we know? You know what i and Keychange do.
All i know about you is that you are really up yourself. This in my opinion
is a fact that is substaintiated by the shit you type. (I feel abuse coming
on again).

> And as for being a pauper, what if I am? even if I would be the greatest

Exactley, proven in a court of law. Is this a class action against
Keychange.
How does one justify postings such as yours when not a single allegation
has ever been heard by a court. Jump out of the playground.

> Anyone being present at a place where a crime takes place or is about to
> take place without trying to prevent it, alarming the official bodies or

What i stand for? Please expand on this point.
In the UK market most of the contributors guessed straight away.
I know that you didn't have a clue. In the same way as you did not expect someone to post against you in an abusive manner (didn't someone else basically tell you to piss off today?).

>
> >Dennis, you can say what ever you want against me. I am proud of what i

One of the big frustrations of Atari Internet use
is the lack of security in CAB.

AFAIK only MintNet provides SSL when used with the
appropriate CAB overlay. Ideally I would like to
see Sting with SSL security but at the moment if
I want SSL I need to use MintNet.

I have tried at least twice to install MintNet but
the documentation isn't clear, at least to me, on
what I need to install. There always seems to be
another half-dozen things that you have to install
before it will work. Then when you manage to find
and download those archives you discover something
else is needed. And so on.

Is there a GemSetup installation out there, I doubt
it.

Ok, I have Mint on my Milan along with NAES and I
use it with the Thing desktop. I have no unix partitions
and I don't use any Unix apps which means that TAR
archives are useless.

Trying to keep the installation as simple as possible,
what do I need to install first ?

Sorry Sean but as everyone read the posting at the time your argument
with Keychange was being held up as a beacon. It is not my fault
if you were being used by others people. You responded to it and
have been used ever since.

The rest of the group has far more important things to do aswell. Would you
like
to tell the group how you blamed veloce for corrupting your hard drive once
it
was fitted even though you hadn't read the manuall and discovered the joys
of TT ram. I suppose that telephone conversation had slipped your mind?
Remember? Ive plugged it in and it's bombing! Not exactley polite where you!
I put it to you Sean that you have been used by others to justify their
actions.

Anyway, we could argue untill the end of time as you have done. All i said
was
that you had been "conservative with the truth". You may continue with your
opinion as is your right but all i am saying is that others have used you to
justify
their own actions.

Dave

That's right. I always have to hit the 'soft reset' key combination
after shutdown but afterwards it comes up again okay.

I too don't understand why ImageCopy should be obsolete because of
PhotoTip version 3.0 coming out. Each of the programs has it's own
strength and weaknesses. And if there is an update of ImageCopy
someday I surely will buy it.

You didn't say if this is the commercial version, AutoSwitch OverScan. The
manual for that is printed, and is quite long. My copy went with the ST I
sold, so I can't help you here.

Do you have any news about the new version that's supposed to be under
development? The latest (3.00 Beta1) public version seems to have introduced
various problems.

Mark Wherry has fallen off the face of the Earth after setting up a new web
site for Gemtrade, a pity, because I know that both you and Peter have
invested a great deal of time in this project.

Use AtarIRC like the rest of us! This program is being updated too.

6452. Rhothron VME Bus Repeater/Adapter

Has anyone heard of the Rhothron VME Bus Repeater/Adapter for the
Atari MegaSTE or Atari TT??

Any info is appreciated.

E-mail me if you happen to have one please.
phantomm@bellsouth.net

Well, the intentions of WDIALOG might be good, but the implementation is
terrible. I run MiNT w/memory-protection, and everything that uses WDIALOG
are killed by MiNT. If extensions are to be invented, they at least need
to make sure it does not break under any of our existing OS's.

> Yet, new applications continue to use it. As a lot of other, quite good

Yes, I was testing the new Phototip, and could not get it to run. N.AES
has a much cleaner WDIALOG implementation which works for most all apps
I've tested, but Phototip told me to install WDIALOG in my autofolder.
This makes me wonder how it checks for the existance of WDIALOG. Anyway, I
tried installing WDIALOG, and all other apps that also use WDIALOG (QED,
Papillon, etc., etc.) were killed with a mem-violation type=free. This is
just downright ugly. So, I did not get to see Phototip, and have ruled it
out because of this.

> applications do not use WDIALOG, obviously it is not indispensable and these
> extensions can be obtained in other ways. WDIALOG is not a standard.
> Why can't they let WDIALOG go into history with other utilities which
> caused too much compatibility problems?

Well, it could be a good thing, but they need to make sure it works under
every OS. At least get rid of bugs in the current implementation that
prevents it to work under Memory Protection. We don't want another Windows
situation where applications are allowed to overwrite eachother, do we?

Regards,

Odd Skancke - ozk@NOSPAM.atari.org - http://assemsoft.atari.org

This is not really a problem, as there are MiNT SCC.XDD drivers
available. These are hsmodem-compatible, and should work well with any
HSmodem using apps :) Try it.

Ditto:-).

Good to hear someone echo sentiments similar to my own. Thankfully
Google has finally enacted the ability to post messages as my
newserver has been totally screwed up since they updated it back in
August of 2000. I have still been reading this NG faithfully. Since
coming back to Ataris some 4 years ago I have pretty much managed to
collect every Atari TOS machine made. I have been playing with all the
different OS available, short of mint and Linux, (which shall be
happening, well when I get around to it:-), and I am always pleased

with what I can do with my humble ST let alone my TTs and Falcons.

Fact is, is that I like TOS based machines.

I wonder why things are said, that the 32 bit Ataris, can't handle a CAB based Javascript, while Amigas are said to be able. Macs have something built into their system that allows iCAB to handle this. (Yes, I get the two Javas mixed up). While speed does come into play, this want/need to keep up in the area of Web browsing is what will drive Atari TOS users, and returnees to newer machines. Of course, what these new machines will be to replace the likes of the Hades and Milan based 060 based units is still up in the air, the fact is that running TOS on a faster machine is still desired by many Atarians.

Hearing the stories regarding the power of Magic Mac and it's compatibility, could even entice me to play with this set up. I am not interested in running MAC programs, because computers today are nothing more than a hobby to me. I would be bored, with a MAC or PC. But seeing developement of TOS Based hardware, or improvement in TOS based software is always of interest to me.

I am an Atarian. My 520 ST with tos 1.0 and 2.5 megs of ram gets as much use as both my TT and Falcon, even with regards to web browsing. What you might ask is someone still playing with a 520st and various versions of CAB for on the interet? Well for one thing it is fun. Seeing a 15 year old computer web browsing still gives me smile. Graphics off mainly. But using a computer like this requires some innovations. TOS 1.0 has quirks. Forty Folder bug is a plague. But as many North American users have STs in their closests and left the scene some 13 to 10 years ago, when they do pull them out of the dust, one fo the questions most asked is, " Can I connect an ST to the internet." Immediately you know that the person isn't going to expect the world, but that it is done out of curiousity or hobby. But once awoken, these users, bored of their PCs, return to their roots. Perhaps the Atari, wasn't as bad or obsolete as their dealers and magazines told them back in 1988. Yes North AMerica was a strange atari market. Abandoned before it was developed. An unfortuneate circumstance. Most closet Atarians in NA don't even know about what occurred in Europe long after they retired their machines. But here you would have said that Atari is dead, that would be pick a year, 1988,89,90,91. Yet even still for some North American developers they continued, against the odds. Was Atari dead? I don't know. Was it ever profitable? I don't think developers in North America made any money in any year, but I can find lots that lost money.

Economics don't rule everything.

As long as I am using my Ataris, or Tos software, or have an interest in a newer faster atari, be it Milan, Hades, Centurbo upgrade, colour card, or a true OS replacement like, Magic, Mint, Linux, Naes, then I am still alive and dying with my Ataris. Always looking for something new to play with. Something new being developed. Something new to

buy. Looking in my house looks like an Atari Dealership. However, no matter how much I buy won't support any software or hardware developer. But every little bit I do, is intended to help.

But it is not me keeping these ataris/tos based platforms alive. It is the software and hardware developers who do it for reasons of their own satifaction.
Such as Mario Becroft. I believe he mentioned his new card is made more out of an interest and desire to support the Atari, then it is to make a profit.

From this starting point is the future of Atari. If a profit is made, then good for any developer. I want them to succeed.

So what do Atari users look for? Well it has to be the same small compact friendly OS that has been with us since day one. A web browser that can handle the modern aspects of using the web. Clearly this message has been mentioned in the past.

Can this be fullfilled by a modern browser and a new hardware platform. And what will this new platform be?

Fact is, I don't think that the Milan, and Hades power, have yet been exploited by the power of a modern browser. Nor has Magic Mac. I am in no rush to abandom my Ataris simply to run netscape or ie.

In the meantime, I will continue to look at new hardware currently available, and spend some time, locating all the old hardware hacks for the ST and enjoy upgrading my STs.

It is a hobby you know:-).

Oh yes, I also do my work on my Ataris.

Its a long post. But I haven't been able to post here in a while, and I feel like I miss this place:-).

Later Brian.

Just thought I would add something Funny. Google, the old deja news,
manages to thread all the forsale messages together. Thus this post
was actually attached to mega ste sales from 1996.

Anyways, I hope Claude gets his MegaSte for $60.

Good Luck. I have 2 of them myself.

Later Brian.

|From: "Sean Barbieri" <root@ic24.net>
|Date: Thu, 17 May 2001 22:20:30 GMT
|
|Hi Sean,
| . . . . . .
|Short resumee:
|After the posting in which you describe how Keychange sold your LINK
|without your consent and then only refunding you partially and then
|seeing the buckets full of abuse and slander you received from Barrie,
|it was time to do something about it: Barrie publicly admitted that he
|sold your LINK without your consent and seems to think everything is OK
|since he payed you back a fraction of the real value... various posters
|here asked Barrie to elaborate on this, but he choose to ignore them.
|So I publicly called him a thief, crook and swindler... :-) since he
|claims to keep records of all his dealings it should be fairly easy to
|proof that you are a liar and that you have given him consent... after
|all, that's what he wanted you to produce all the time, why he wanted you
|to provide proof when he got all the records, is something only he knows.
|
|This happened some six weeks ago in CSAST-tech, his only reaction was
|that he would take me to court, but so far he didn't even try to proof
|that what was said is untrue... apart from the usual abuse and slander
|ofcourse, but I'm used to this coming from keychange.
|Oh yes, I also called him a pirate and accused him of undermining our
|platform since he spreads illegal commercial harddisk drivers of ICD
|and by doing this hurts the sales of the only supported harddiskdriver
|left.... yep, you guessed right... no comments either, apart for the
|usual slander ofcourse
|
|Well that sums it up somewhat....
| . . . . .

That is a useful summary of the problem (from one side's point of
view, of course). Not downloading CSAST-tech, I missed the beginning
of this 6 weeks ago.

There doesn't seem to be much point in this argument continuing in
public, is there?

> was fitted even though you hadn't read the manuall and discovered the
joys
> of TT ram. I suppose that telephone conversation had slipped your mind?

No it hasn't as I have *never* had any problems with my Veloce corruping my
hard drive!
I know how TT Ram works and apart from one or two programs that don't like
it - reset the flags and everythings ok. I have _never_ contacted you about
any hard drive corruption as I've not had any using my Veloce+4.

> Remember? Ive plugged it in and it's bombing! Not exactley polite where
you!
> I put it to you Sean that you have been used by others to justify their
> actions.

I have *never* said this in any conversation to you - telephone or
otherwise as I've _never_ had this problem! The only problem I've ever had
and contacted you with for advice was that my screen split in two some
times on a warm boot - that's all. you said this was a known bug (and

offered to fix it I may add) but I left it at that as it was not a real problem. I can only assume you have got me mixed up with another client somewhere along the line. I have never been more than polite in any dealings with you so please review what you've said here when you've realised your confusion.

I've found the email from yourself btw and have also included my reply.

Regards
Sean

Hi Sean,
This is getting rather silly. I have read your post and spoken
to Barrie. This needs to be stopped. If we all posted comments on
suppliers over the years then nobody would trust anyone again.
I don't know Steve Sweet but as you have leapt to his defence i can
only presume that you are friends. Myself and Barrie have been
friends for 8 years and he has vigoursly defended the platform for
music use since i can remember. I do not want to see this mess
esculate further, as you inferred, Steve says as he finds an so does
Barrie. We both have the ability to stop this and come to an amicable

agreement. If you would like to try and sort this out without other peoples
intervention then either drop me a mail at dave@abrasystems.co.uk
or phone 01625 503448. As it the company phone bill i can ring you
back.
Please do not post this message to the group or any other person
as it is for our personal discussion only. I hope you can respect
my privacy in this matter as i would respect yours.

Dave Escott

>suppliers over the years then nobody would trust anyone again.

Yes I agree, but, suppliers who treat their customers with the
contempt that Barrie has done should also not be allowed to do so.

As I said I personally have been on the wrong end of this myself
so can only speak for myself, but all I can say is it was the worst
service and treatment I have received from *any* supplier *anywhere*.

As Barrie was the one threatening legal action I felt compelled to
back Steve here as I _know_ the service I received which, if listed,
would show Barrie in a very bad light - although he states it doesn't

bother him, which unfortunately maybe says a lot...

If I were to write you a full account of my experience with Keychange - not that I have the time atm - you would (I hope) be shocked too. Basically a catalogue of ignorance, arrogance together with lies and also selling someone's property without their permission you can also add criminal in most people's eyes. As I say, I eventually wrote it off as a bad move on my part to even get involved with Keychange rather than use my normal supplier, as the costs involved in carridge, phone calls far outweighed the worth of the goods purchased. I personally didn't have the time or inclination to continue with continually sending things back which either didn't work or were not put together properly or for that matter dealing with the rubbish Barrie was comming out with constantly.

>I don't know Steve Sweet but as you have leapt to his defence i can
>only presume that you are friends.

Only through Atari forums and the like. I obviously don't agree with some of the things he says but when he is attacked for telling the truth - - which he is and *we* know it - this is not right.

>We both have the ability to stop this and come to an amicable
>agreement. If you would like to try and sort this out without other
peoples
>intervention then either drop me a mail at dave@abrasystems.co.uk
>or phone 01625 503448. As it the company phone bill i can ring you
>back.

I have no power or influence over Steve so the more Barrie antagonises him the worse things will get as more people will give their experiences - and I personaly know of _at least_ one other case who received the same treatment I did.

>Please do not post this message to the group or any other person
>as it is for our personal discussion only. I hope you can respect
>my privacy in this matter as i would respect yours.
>
Of course, but if Barrie tries to lie about my case and say that the things stated did not happen - to which I have witnesses - I will not be happy. hopefully sense will prevail and he will not though. Although judging by his
posting today, he has already "confused" himself with total inacurracies - - to which I have replied.

Most people who know me know I'm a very reasonable man. For instance when my Veloce+4 had delays because of unavailabilty of chips etc - no problem. When after 2 months the power supply blew up, I never contacted you cause I know it is an old machine and these things can happen. So I am by no means the "customer from hell". I was greatful that you upgraded my machine to the Veloce+4 which gave the machine a new lease of life. I'm just sorry you don't continue development of Atari mods (I understand totally why you don't though) as we miss this sort of innovation these days.

On a different tact, what PC modifications do you do these days Dave? As I
am soon to get one (have not one yet) and was wondering what you do now.
I remember you saying that you've moved into PC's - hope this is going
well for you.

6467. milan serial ports and sting/ stik

Newsgroup: comp.sys.atari.st
Date: 2001-05-21 19:48:28 UTC
From: Zogging Hell!!! <tjw@zhell.co.uk>
Message-ID: <3b096e70$0$21938@news.zetnet.co.uk>
Source record: 45999

Hi,

I don't know whether anyone out there can help, I'm one of those pariahs with a Milan computer. The things is although the serial ports work (or are recognised) correctly under iConnect, they refuse bluntly to be recognised by STiK or STinG,
as you can imagine this puts a lot of the Atari's best internet software out of my reach, unless I resort to buying iFusion.I'm using your plain vanilla Milan with 32 megs of memory, with Mint/MAES as the operating system. I am also using Milan's serial drivers for HS modem.

Any help will be greatly appreciated,

Thanks

Sorry, Lonny, I think this is a misunderstanding. I surely did not want
to doubt or ridicule your statement in any way. Maybe bacause English
is not my native language, my post did not mean what I intended it to.
I questioned the wisdom of using WDIALOG, and by "developers" I meant
the author of Phototip, not you.

Best regards;

Well, we mostly act as an intermediary between users and authors. One of
the main goals is to avoid the language and currency problems for the
user, and therefore he have no more reason not to register and can
support the shareware scheme without hassle :-).

This being said, we do not stock programs. And as I said, FaST Club
looks to be unreachable unfortunately.

You may want to check out 800XLDJ for you 130XE and 800XL. This program
emulates an 8-bit Atari disk drive and uses the SIO2ST(PC) cable. Just
hook up the cable to a ST (or TT, Falcon, Hades, etc) through the modem
1 port and then to the 8-bit computer. Then run the program and install
DI image disk, turn on your 8-bit computer and the DI image disk with
load. Makes it nice to store your 8-bit program on the ST's hard disk.

Well we'll see what you decide to fabricate. Going by most of factually
inaccurate statements you have issued in my case (and once corrected you
have chosen to then convieniently ignore them) it should be _very_
interesting :-) You didn't agree to a hard drive refund and then change
your mind stating you were upset that I was using another supplier plus
some total fiction as to the drive case being damaged? You didn't decide to
sell my Link 97 without even bothering fixing a price and when I said I
didn't want to sell it you said it was tough you had already sold it! If
you state this is untrue then YOU are the liar and my family will bear this
out no problems whatsoever.

Sean

I don't know where you got that "last update date" from but look at the
bottom of the page:
"Last updated on: Saturday, March 3, 2001". The page hasn't been updated
with news on the Milan III since the "early announcement policy" seemed to
be a bad idea. The Milan II was canceled a while ago for various reasons.

Greetings,
Matthias

Sorry, but no confusion here. The split screen problem was not a bug but
was caused by the Video ic not being ready for the data as the boot process
was
much faster with veloce. Everyone was told that no fix was 100% as
the problem was with the video i.c.
I remember you blaming veloce for crashing the system on boot
once you had loaded the software and rebooted. You may feel
that your attitude was justified but i must say that you cannot
always blame others when problems lie elsewhere.

According to certain people in this group i don't know what i am on
about, I never read the threads or never tried to do anything before
posting ? As i have stated before i know because i was there.
I have pointed out before that Sean sees it his way and Barrie sees
it his, if Sean had really put it behind him in _1996_ would he still
post and try to justify his manners? I will add that some people seem
to think that a supplier is there to _serve_ them instead of thinking for
themselves. This of course is my opinion but i don't know what i
type do i Dennis? Come on Lai tell the group what you typed?
Is Lai a story teller? Yep. He most certainly is. Or would Lai
like to prove me wrong?

Dave

Make up your own minds.
But do it before other members switch off aswell.

And what would that be, 2 crates and a curry before hitting the bottle?

Why should i be "civilized" Dennis?
Your side kick certainly has a way with words.
Maybee when you're next over here you can help him dry out?

But then again didn't he get the sack for being a drunk or am i wrong?

Ok, this will be my last addition to this thread.
I would indeed encourage both Steve, Dennis and Dave to continue any personal vendettas in other areas. And for the last time Dave, it is not interesting or even important who started the abusive language since you are all doing it. It no longer about keychange even, you are only yelling at each other. This last one pretty much sets new low standards. Time to tweak the killfile.

As for keychange, I personally would not do business with a company that is so careless about how they appear in public. And that goes regardless of what is right or wrong about all the accusations that has been going on here lately.
I am definately convinced to look elsewhere for atari stuff.

bye,

Joakim

Hi Peter

I know the feeling, was thinking about it a long time before I did
it, mainly beacuse of the lack of doc's. But then I took a look at
Marc-Anton Kehr's site, great Mint-net info. Can't remeber the url
but I know there's a link from freemint.de. Look under Mint-Net For
Lamers.

6492. Sound analysis software for Falcon?...

Newsgroup: comp.sys.atari.st
Date: 2001-05-22 02:05:16 UTC
From: De Clair <studio@iq.pl>
Message-ID: <9echj5apo1@news.onet.pl>
Source record: 46025

Hi,

Does there exist anything like that? I do hope it should have one day, but I have no idea where I could find it. I need some kind of oscilloscope, spectrum analyser and similar utils being able to work in real time on a Falcon via its audio in and out sockets. It's expected to serve for educational and professional purposes as a controlling tool for sound synthesis. Can anyone help?

Thanks & best regards,
De Clair

6496. Happy Computers Discovery Cartridge on Meaga STE's

Newsgroup: comp.sys.atari.st
Date: 2001-05-22 07:33:55 UTC
From: Steve Stupple <Steve@atari.org>
Message-ID: <doqtLhAjZhC7Ew0o@atari.org.uk>
Source record: 46031
Cross-posted to: alt.atari,comp.sys.atari.st,comp.sys.atari.st.tech

Has anyone been able to run these cartridges on the mega ste's or Falcon
or is there any updated software that will allow these to work on these
machines.

I can see the additional drives that the cartridge can add would be
helpful for Falcon owners.

Just in case anyone doesn't know what these cartridges are, here are
some details.

This is the BEST disk backup hardware available for the ST and can back
up not just Atari disks. The cartridge takes over control of your floppy
drives AND only needs ONE floppy drive, unlike blitz and syncro system
hardware. It also verifies the data on the drive, making very accurate.
Compare it to the blitz turbo hardware, which is very hit and miss!

Once you have got the parameters set for a specific disk, it will
duplicate that disk EVERY time:)

It also has the facility to read the disk into a file and takes
advantage of you system memory.

Now that's the BASIC version or OPTION 0.

the other options, which can be added, are: pass through cartridge port,
an extra 2 external floppy drives, real-time clock, and even able to use
it as a Mac emulator (like the Spectre).

I had the same problem (with authentication) with that too, but I haven't tried it recently TBH.

I've also found that no versions since 0.77 will run on my CT2'd Falcon. I have to cold boot the machine to get out of the lockup that takes place as soon as the program runs.

6499. [ANN] MagiC SDK

Newsgroup: comp.sys.atari.st
Date: 2001-05-22 09:39:08 UTC
From: Pascal Ricard <paricard@free.fr>
Message-ID: <3b0a3a2eba3832@free.fr>
Source record: 46033
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hello,

MagiC SDK

Europe Shareware is now able to offer a complete software development
kit for MagiC to all the programmers. This package includes:

ï¿½ either MagiC Atari or MagiC Mac or MagiC PC, with paper manual
ï¿½ The GCC kit
ï¿½ GCC Shell, registered version
ï¿½ Ressource Master, registered version, with paper manual
ï¿½ Windom libraries with its printed documentation (200 pages)
ï¿½ EZ Edit text editor (with syntax "colourisation")
ï¿½ Many development libraries
ï¿½ Many development tools

All this for only 75.00 Euros !

This offer is for developers only. To have the advantage of this offer,
you must tell us which MagiC compatible programme you have made in the
past 24 months or which one you are going to produce in the next 12
months.

Have a look at the MagiC SDK page:
http://www.europe-shareware.org/atari/logiciels/magic_sdk.html

Bye,
P. Ricard (ES)

Heheh... well a 1200 mhz PC is nothing to sneeze at either.

But I have to admit, I like the fact I can check my E-mail with the
simplicity of a Atari 800 and a BBS. ;) No hard drives, a TV screen....

It's just fun.

Well I know how it goes. I had a TT that I was not using very much, and figured I could get all IU wanted to get done with my 1040STf with 16mhz AdSpeed chip. Great speed, and more compatibilty with programs than the TT.

While this has remained true and I love my 1040STf (and the money for the TT was used to buy Battlesphere for the Jag), I miss the little icons on the TT screen, the various resolutions, the speed at which all things (that worked on the TT that is) ran at. Even the case, the keyboard, the scsi port.. sigh! My Atari TT 030 is missed.

Truly, if I had to do it all over again, I would get another TT or a Hades. A Falcon? Well, since it doesn't run Spectre I would have to say that is it's main deterent. :(Enough of one for me at least.

Take care, and don't worry, Falcons (and other systems) turn up on here every so often.

You are right about this group being public, you are SO wrong about my
attitude.

If I let vermin and sweat post libellous and defamatory statements at will
I may as well shut up shop, which is their declared intent.
You should remember I have never knowingly dealt with either of them.
I will always fight fire with fire where my reputation is concerned.

> I am definately convinced to look elsewhere for atari stuff.

Explain.

Either you believe the rubbish that vermin and sweat have published or you
can't stand robust public debate. I have already agreed with you that
another
group would be more fitting but until the libellous posting cease I have no
real option
but to defend Keychange where necessary.

This seems to be a machine dependent question. It runs properly
on an STe with tos 2.06. When booting on a TT with 3.06, I think,
it either tries to or reports that some other program tried
and failed to open a window or find a file, generating alert
boxes that need to be cleared. This behavior generates fatal errors
when running MiNT on that TT, and MiNT exits immediately.

Have not tried MiNT on any other operating system version.

>real option
>but to defend Keychange where necessary.

I am not in the position to tell if Dennis or Steve has some truth to
their stories. I would not have a clue since I am don't know them at all.
The point is you are giving your business a very bad
name by the way you are defending it here on usenet. Fighting fire
with fire will only set your own own domains on fire I'm afraid.
But that is your choice, and the way I wish to respond to it is my
choice obviously. You should however be aware that you might loose
potential customers by your postings, which others have already
pointed out I believe. Personally I'd say that the way you have been
responding to Sean is enough for me to get a very bad feeling about this.

Enough said.

/Joakim

You're forgetting that Linux S U C K S. It really really sucks. Those animators have particular needs which Linux will supposedly fulfill, but Linux will never be a major contender in the desktop OS market. UNIX will never be. They had their chance in the 80s, nowadays people have come to expect such things as ease of use.

>> linux, unix are ok, but the average user/business's only know windows,

Granted, Apple could be, and already is, a major contender in the desktop market, but never Linux. It's not just because of the narrowmindedness of Wintel users, it's simply because Linux is a system from the 70s.

I'd sooner put my bids on BeOS. Or AmigaOS. Or TOS.

Yes, I think that is what it is! I found an old article back in 1991 were a guy had one of these connected to a TT. He had lots of wild hardware running with it and wrote his own software with GFA Basic 3.6.

Yes iwe considered that option already, thx for tip anyway!Id got
myself 1050 drive, but newest demos and stuff require hardware updates on
floppy etc.. do u know if this software can emulate those new floppy
formats?

There is software named Analyzer.. U have two osciloscopes, two
spectral analysator (for each channel), 2 VU meters and some odd oscilo
look thingie... all works realtime, just resolution is not profesional...

Also i think Whip! would be VERY good for educational purposes, it
process incoming soumd, and display various effects then, from hires
spectral analyser, flight into osciloscope to demo effects etc... a VERY
VERY good app, a lot better as Jaguar's VLM for example..

Depending on how much you already know the thread may become lenghthy. If
you need help just email me and I'd be more than happy to get you going
with some software. CAB 1.5 on an ST is pretty bad these days, but 2.7 is
fine for non flash/java sites, but you may find a lack of speed. Email,
news, well that's easy for an ST!!

> much faster with veloce. Everyone was told that no fix was 100% as
> the problem was with the video i.c.
Yes you said that. I was quite happy with your response as it was not a
real problem as I stated. You obviously have forgotten(?) but I asked if it
was something I might have done to cause this and you said no it was a
"known problem" if not a "bug".

> I remember you blaming veloce for crashing the system on boot
> once you had loaded the software and rebooted. You may feel
> that your attitude was justified but i must say that you cannot
> always blame others when problems lie elsewhere.

???? Totally incorrect and I can prove this - but I see I'm wasting my time
with you now. I thought you would have the good grace to retract what you
said but obviously not. I'll leave this ridiculas "story" at that.

> > > > Dave, I *still* have respect for you.....
I now retract this statement.....

> I have pointed out before that Sean sees it his way and Barrie sees
> it his, if Sean had really put it behind him in _1996_ would he still
> post and try to justify his manners?

I _had_ put it behind me before Barrie decided to attact Steve and laterly
Dennis for no good reason.

I shall not post *any* further comment here pertaining to this subject at
all, only to say that I will now organise my own and obtain a "first hand"
witness statement who heard "Every word" about the hard drive/Link 97 from
Barrie's own mouth - Hands free phones are a wonderful invention! Who also
incidently helped me pack the so called "damaged drive case?" and will
verify it's condition, as well as it being sent recorded delivery - as they
in fact sent it! :) This I mentioned in my second posting which will prove,
if I'm required, that I have not lied about Barrie's actions. My solicitor
will keep these on file as and if required.

Best Wishes
Sean

I know I should lurk for six months and wait for the FAQ to be posted, but I bought an ST for 10 marks at the flea market at the weekend and I want to know what I can do with it!

It's a 1024ST (with an E in tiny print next to the rest) with a SM124 monitor. I got some cables, WordPerfect for the Atari, some other disks and a dot matrix printer with it.

Can I do anything useful with a DD floppy disk or should I start looking for a hard disk?

Hi Barrie and other traders.

>I have no use for them so they are for sale. Offers?

I'm going to try to be civilised for a few moments.. :-/

I'd like to make a suggestion, in a civilised, calm tone of voice..

Since myself and a large number of other people object to the appearence
of adverts for business's in this base, could traders not reply to any
potential business opportunity directly to the requester via eMail.
You'l still get your trade and we dont have to pay to dowload it.

People could still openly request their needs and get offers as
requested.

Other peoples opinions welcome, please.

Congrats! You're better off getting a HD but you are able to get along with disks. Also, since you have an STE you can upgrade to 4MB really cheap. Get yourself 4 1MB SIMMS and put them in the slots in the computer and BOOM you've got 4 megs of memory.

6539. Help : Reading a Vidi-ST (12) RGB file on a PC

Newsgroup: comp.sys.atari.st
Date: 2001-05-22 22:11:40 UTC
From: Bob <a@b.c>
Message-ID: <ovBO6.12260$m93.1888770@news6-win.server.ntlworld.com>
Source record: 45972
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a number of RGB files grabbed with a Rombo Vidi-ST (12) digitiser.

Does anyone know an easy way of reading these files on a PC?
Or the file format perhaps?

Ideally I'd like to read the file directly into something like
PaintShopPro - rather than go the Atari emulator running the original
software route.

Any help appreciated.

6540. Re: intenal Falcon HD

You'll need a 2.5" to 3.5" adapter. Physically fitting the 3.5" drive internally is possible if you remove the internal shielding and a support leg for one of the screws on the bottom.

Joshua.

What TOS did the Atari computer this disk came from have? If the TOS was 1.4 or better, then you should be able to insert the disk right in the PC and have it read. If it was less than 1.4, then you might try a ST emulator. I have heard some Atari disks can be read on a PC going this route.

I cannot remmeber the name of the program, but it is the best puzzle game I have seen. You get a puzzle to solve, then after you are done, the puzzle becomes a piece in another puzzle and so on. I have the game somewhere if you want a copy. It is freewhere and came with my ST.

You have 1040STe just like mine. It can have upto 4meg of RAM, which is
alot for most anything you could do on that machine. I would get a hard
disk for it if you want to anything serious on the machine. You can do
alot with it like play games (tons of those exist for the ST), use it
for MIDI (the ST has built in MIDI ports), word processing, DTP and more.

6548. Whats 4 bombs mean on my ST?

Newsgroup: comp.sys.atari.st
Date: 2001-05-23 00:20:20 UTC
From: James Alexander <jamesalexander@sprint.ca>
Message-ID: <3B0B0244.14268DB@sprint.ca>
Source record: 45982
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hiya,

I've got a used 520ST, one of the originals with external floppy disk. Its been upgraded with a zubair 2.5 meg ram upgrade and a TOS Extension Card. Its set up to boot up in TOS 2.6. Problem is, when I power it up, it does the memory test (and passes it) then does the delay to allow the hard disk to spin up, when I press a key to go on or wait for the delay the machine bombs every time with 4 bombs. Has anyone had a similar situation? or better yet does anyone remember what error is associated with 4 bombs?

thanks,
James

6549. Printing with 1st Word on a 520ST with Master-3S

Newsgroup: comp.sys.atari.st
Date: 2001-05-23 00:20:25 UTC
From: math1947@yahoo.com

Does anyone recognize this problem, and have a fix?

Have a 520ST with a single Master-3S floppy drive. The directory windows on 1st Word show no files at all, though can create new ones and edit old ones by typing in the file-names. However, 1st Word cannot find any files when asked to print them. (One ugly way around this problem is to replace blanks with underscores, then use the TOS operating system to print the files.)

Thanks.

GH

Hi Andy & Dolan,

I don't have the perticular programs your looking for but I do have a few pd programs in my collection that I could arrange to send to you somehow. The atari club I'm in is starting to put together a CD rom of shareware for the ST and threre'll likely be a few of these on there as well.

His name that he used to give is Peter Sinclair Day. But since he's been spewing vitriol for years and proven to be full of crap time and time again he's been given the nicknames of sinclap, sinCRAP, or tifkas (The Idiot Forever Known As Sincrap). And what does he have to do with the useability of Atari systems or any other computers? yep, you guessed it, NOTHING!!

>Anyone got one of these for sale?
>

It's a really cool backup system. There were 2 versions that I know of
one was Large and had options like a pass-thru port and etc that Steve explained
And I think they made a small one without any of the options, about the size
of a dongle. The Large one is the biggest Cart I've seen for the ST/STE, it's
larger than the Spectre GCR cart.

I did have my large one up for sale at one time, but no one was interested
and I have changed my mind about letting it go. These things were fairly
expensive when they first came out.

If you want, you can e-mail me the name of the disk you need a backup of
and I maybe able to tell you if it can be backed up by the Blitz Turbo
or the Discovery Cart. Steve can probably tell ya as well.

I hope it keeps on going for a long while. But I've noticed a lot of shrinkage. back when I got my 8bit in 1988 there were still a number of 8bitters and tons of ST users and 3 user groups in town with hundreds of users each. Now I've just gotten back into one of them last fall and its down to a short 4 page newsletter, no bbs and meetings are being moved to peoples homes due to lack of attendence, a typical meeting this hear would have from 6 to 10 people. What I suspect is that there are a number of atari users around who like me at one time, aren't part of a user group or make regular appearances in the newsgroups. I used to run into quite a few people in that position while bbs's were still popular.

Hello,

I am not sure if this is what you are looking for.
There is a program called AVALON by STEINBERG.
(Maybe the one Tony K. mentioned)

It is a sample editor. Gives you graphical control over your sounds.
Works with most samplers (older ones)

Pardon me if I've got the wrong end of the stick, but you ARE using legal DOS
filenames for your documents?

Unless you are running MagiC or MiNT you can't use blank spaces in filenames,
letters, numbers and underscores more-or-less only.

>>next 12 months.
>
>Why so restrictive?

Because this offer is only for developpers.
The customer price for MagiC is 99.00 Euros (Aniplayer registered
version included).

So, with the MagiC SDK at only 75.00 Euros all the customers would prefer
to buy the MagiC SDK.

But the MagiC SDK is only for active developpers or beginners who want to
produce softwares for MagiC.

Every coder can contact directly the Europe Shareware staff to lower
these restrictions, but you've to show that you're here to create
softwares in the short-term.
We're open to discussion, don't hesitate to contact us !

Sorry, I lost the original posting to this thread so I reply to this one instead. I have a supradrive connected to my STe and have heard from others that these drives might be picky about the driver and not working properly under hddriver. I guess you might wish to try hddriver first, since that is a driver that is up-to-date and all, but if the fails I have the original disks and could send a copy if needed.

Regards,

Joakim

In a file name you can't have spaces, only underscores, which is why
they're not being seen.

You can use "makedisk" to convert an Atari floppy disk to .st or .msa image.
Than you can view files in any ST-emulator and copy to hard disk.
The adress is: http://makedisk.atari.org.
You should run program "in real DOS mode".

I don't think that such thing ever existed.
And why Ramdisk via DMA port ? It can't be much faster than any newer hard disk, and only faster in access time, but is much more expensive. So why produce such thing ?
And of course... q: why you need it ?

4 bomb is for illegal statement.
I think that it happens when you don't have floppy drive attached, or there
is some error around floppy controller - TOS 2.06 specific error.

From: j00ce@hotmail.com
Message-ID: <9egkdn$hc4$1@pheidippides.axion.bt.co.uk>
Source record: 45903

Hiyas,

How do I check the current amount of memory in one of the above beasties?

Managed to acquire one of each - both are working, and I have epic quantities of disks for both, but my previous experience of ye Atari ST is fairly limited (as in: I borrowed one about 5 years ago for a week, and played games on it).

I discovered a mini-faq thing, and by browsing it, discovered that the 1040 at least used 30-pin simms (and upon dismantling it discovered this to be true).

Is it worth upgrading it (if it hasn't been already) to the full 4 megs (as I have a bag full of 30 pin simms hanging around), or will none of the (5-boxes-of-floppy-disks) games take advantage of this epic amount of memory?

Cheers!
juice (the bracket using one)

If you havn't tried it don't knock it ......

Firstly, it should be significantly faster than any disk. Seek Times are
still measured in milliseconds.......
On the ST and STE you could only have 4Megs of ram without major hardware
and software surgery
so RAM disks would allow work files to be in a fast place. Seems like a
great idea to me.

Orginal cartridges looked like a readonly disk, so why not a RAM disk. The
cartridge port
has no write line, so its not an easy place to put writable media, why not
on DMA port...

About the time the ST's were produced there was considerable interest in
Bubble Memory
and it was often touted as a replcament for Floppy or Hard Drive as it had
faster access times.
However Hard Drive capacity increased much faster than bubble memory and the
costs plumetted
and it died a death.

However a quick search reveals that memotech (http://www.memtech.com/)
produce similar
devices today using flash memory, with both SCSI and IDE interfaces,
so either shoulkd work with an ST with the appropriate interface..

Cheers,
Big Daddy Dave.

> floppy formats do you have in mind?

Well hard to say, but XL scene is still active, esp in Poland, and they
have hardware updated floppies, more sectors, faster acces etc.. Some
realy amazing stuff, like for example Asskicker demo etc, runs on such
floppy drives...

I used to know a trick for converting an ST disk to be readable
on a PC.

IIRC it was a change to the media byte in one of the first
disc sectors. By simply using a disc editor to change the
value of the media byte the PC would recognise the disc
and it could be read.

Does anyone else remember this trick ?

Don't experiment on anything you value and make a note
of any changes you make so that you can change them
back if it doesn't work.

Hallo Derryck!

DC>I've also found that no versions since 0.77 will run on my CT2'd
DC>Falcon. I have to cold boot the machine to get out of the lockup that
DC>takes place as soon as the program runs.

That's a known limitation of AtarIRC and is _not_ machine-dependant. It will
hang as soon as as the iconnect stack is active or just loaded.
Workaround is to use STiNG, STiK(2) or MiNT-Net as IP stack and entirely
deactivate iconnect.
With STinG, AtarIRC works well on both my CT2B Falcon and my Milan 040. You may
meet me wendsdays in #atari.de (from 09:00 PM Middle European Summer Time).

with best regards
Ekkehard

There is one device that I know of for the ST/STE that does have a RamDisk
on the DMA and it is the SuperCharger PC emulator.
When not using it for DOS, you can use it's memory as a RamDisk in ST mode!
I think this is very interesting and was wondering if anyone had made
a RamDisk only device for the DMA. I know it can be done as it has already
been done with the SuperCharger.

David makes several good points. The limit of memory being around 4 megs
for the normal ST/STE. I could use a few more megs myself, Especially on a
MegaSTE.

A DMA RamDisk should be very Fast! I'm not sure what the Ram limit would
be. The SuperCharger has 1 Meg of memory that can be used as a TOS RamDisk!

First of all - thank you all for replying. I've never heard of anything like Steinberg's Analyzer/Correlator, but it's quite possible they released something like that years ago. Today Soundpool still supports software called Analyzer (it's about DM 200 as far as I can remember), however it's oriented towards recording rather than analyzing (thought it provides some kind of 'grown-up' peak controller). Avalon is not actually what I've been looking for. I've recently bought it second hand (v. 2.0) together with a dedicated 16 bit D/A board, but - as you write - it's a sample editor and not a stand-alone analysis application. So it won't help me showing the students the effects of, say, ring modulation the same way I could do it with a hardware oscilloscope...

Regards,
De Clair

If the games are arcade stlye and pre 92 maybe 94 then they'll run on 1
meg fine and will not take advantage of 4mb (the official max on a ST).
You might as well put them in though, as it doesn't affect any games.
(although one or two did have a problem, it's unlikely).

If you want to see what's in it, then check out a program like Mark Baines
Profile (version 2 is the latest AFAIK).

>MegaSTE.

Isn't a RAM disk an icon that appears on the desktop and works as a drive
but uses the internal system RAM? Putting an external ramdrive wouldn't
give anymore system RAM. If you used an Axiat Magnum board there are some
RAMdisks that can use TTRam.

>A DMA RamDisk should be very Fast! I'm not sure what the Ram limit would
>be. The SuperCharger has 1 Meg of memory that can be used as a TOS RamDisk!

There wouldn't be one. TOS would think it is a hard drive (just like a
megafile) but the drive would jsut have chips instead of a platter. Good
idea actually, should be able to emulate a hard disk quite easily, just an
ID etc, but again the problem comes in using DRAM, can be difficult to
implement (without some hard work) and SRAM is too expensive...

I think it would be good to stick to a scope for this as the DAC may miss
some of the signals, and controls on a scope are always easier.

Problem is that DMA of ST or STE has limited speed. You simple can not
go behind 1.5-2MB/sec .
This is main reason, why I think that it's better to use hard disk.

> However a quick search reveals that memotech (http://www.memtech.com/)
> produce similar
> devices today using flash memory, with both SCSI and IDE interfaces,

Yes, it is good idea... if such flash modeles wouldn't be very expensive,
what they are.

Btw. Compact Flash or Smart Media cards are much cheaper and easier to
find.

I just maked last week interface for connect Smart Media card to ZX
Spectrum - 8 bit machine. It is great thing - small, low power cinsumption,
fast etc...

Making interface for ST would be also easy to construct, and as I read
Compact Flash cards can work as IDE disk.
But again, speed will not be impressive.

Finally, instead using DMA port, we have other ways to increase maximal
RAM in ST machines. Some cards existed up to 14 MB.
But maybe is best way to use some CPU card with 32 bit processor.....

Fair enough, I'll get back to you. Would it simply be a case of placing
the new drive in and connecting the original leads into this one? <dumb
question, I know!>
How much would u want for the drive?

Thanks, Steve

MiNT has a port of "dosfsck" that handles every variation on the
FAT filesystem, including VFAT long filenames and FAT32. It does
a good job of defragmenting filesystems and also cleans up lousy
file deletions done by some applications.

I never tried it on Magic, but it should work if started as a TTP
application with the drive letter as an argument.

I need to be more specific: Have not used blanks in the file-names.
Used 1st Word to replace blanks in the text with underscores,
because my TOS operating system will delete blanks when it is asked
to print a file. TOS was the only way I knew to get the files
printed, as my 1st Word cannot find any files when asked to print them.

Mario,
Thank you for your offer, however:

1) I am still deciding if it is worth it at this time, I will set some poll, stats etc (i don't want to start a project that i can't finish).
2) You would definitely be able to help, however the skills required in this project would be sub-standard to you. Anyone would be able to give the same kind of help as you would, you need to concentrate on things no one can do, that is finish your drivers for galaxy, ethernet etc. The Sparemint project will do fine without you, (not to reject you at all!, would love to have you onboard), just that it is very important to manage the resources I have, what's worse than using a java programer to clean the floor because it is dirty? that's mismanagement of resources, same thing in this case, you need to concentrate on what you do well. And THANK you VERY much for the offer :) very much appreciated!

There doesn't seem to be anything on Mint-Net on his site.
The Mint-Net stuff on FreeMint is in TAR archives and is
in German.

Hi Peter

If you go to Marc-Anton's homepage:
http://www.ndh.net/home/kehr/atari/menu_e.htm
And then you click on 'Projects' and then 'Mfl', you will find both
documentation and downloads. If you need any hints, email me and
I'll try and help or else email Marc-Anton. Good luck.

I have a very nice Shadow of the Beast for auctions this week with no bids yet, and a super low starting bid of $3.25. Please check it out, this is a classic, impossible to find at a dealer anymore, and easier on the eyes than the Lynx version. I also have tons of other Atari games for sale if you check my other auctions. (57 items in all!) Thanks for reading my post and good luck bidding!

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1238688048

Also here is my want list if anyone is interested, feel free to use any of these items (if you actually have them) as credit towards my auctions:

800 xl Boulderdash cart I will pay $30 ($36 auction credit) for (in good condition)
800 xl Pastfinder cart I will pay $25 ($30 auction credit) for
800 xl Alley Cat complete boxed I will pay $20 ($24 auction credit) for
800 xl Agent USA complete boxed I will pay $25 ($30 auction credit) for
Atari ST Moebius RPG complete will pay $25 ($30 auction credit) for

Thanks -Satcom2

Hmmm, I seemed to have heard something with regard to the maximum
size hard drive diamond edge could handle. I have this software, and
have never used it for the very reason above. I am too worried, that
it will screw things up instead of fix it.

Sorry to hear about your bad luck.

Brian.

6603. Re: Most famous MONOCHROME games?

There was a very good arcade style hack n slash that worked in mono. Like a Barbarian fighting style game. Heavy on the digitized music. I have it, but can't find it off hand. Very good graphics for monochrome. Works in colour too of course.

I prefer easy going GEM style games, like Gemtrek. Simple easy paced;-).

But the arcade game I have, actually it surprised me that it worked in mono, really livens up a serious days work.

AH, Targhan. That's it.

Later Brian.

Ii¿½m not sure Soundpool (CD-Recorder 2?) supports your CDRW.
Drive is new. Also CDRW 2100S isnï¿½t found by Soundpool software.

That make more sence, the reason that there is no spaces in the text when
you print out from TOS is that it the file you are printing is word
processed, if you deselect the WP option in one of the menus and then save
the file a warning will appear stating something like "you are saving this
as an ASCII file" and some other stuff that I can't remember off hand. Click
on OK to save the file and you can then print it out from the desktop and
all the spaces will be in place.

However you should still be able to print from within the program, when you
have a file open try selecting "Print Current" from one of the menus this
option should print the currently displayed file.
Have you set up the Printer Driver?.
What exactly do you mean when you say it cannot find any files when asked to
print them, do you mean that they are not displayed in the file selector?,
if so are you sure that the file selector is pointing to the same directory
that your files are stored in?.

I looked it up last night, IIRC 4 bombs means an illegal instruction.

Did this set up ever work?, if it did then it could be a loose connection to one of the upgrade boards, if not then it could be a hardware problem. AFAIK TOS 2.6 will assume that there is a Blitter Chip fitted as the original STs it was installed in would have been fitted with them, most 520STs espically the early ones did not have Blitters fitted and so unless someone knows otherwise I suspect that TOS is crashing because it is looking for the the Blitter Chip and can't find it.

So when you print using TOS it is removing all blanks from text and print
as one continous line of text? When you choose show what does it look
like, and when imported into 1st Word are there spaces or not?

Sounds like a problem with the format not quite being proper ASCII
standard.

Hi 2,

I always liked Flight Simulator II, in fact I bought an Atari for it.

Another one running in monochrome was Moonbase. Kinda ATC program but
purely as a game.

>hang as soon as as the iconnect stack is active or just loaded.

I'd been coming round to thinking that the problem was most likely due to either IConnect or Ifusion, but then again no other programs actively dislike that combination. In fact, it's quite possible to have both IConnect and STinG/STiK stacks loaded together, and use their respective dialers to decide which stack is used for the actual connection. Lonny, any chance of removing this problem please?

Thanks for the reply Ekkehard, I'll work on it over this weekend :-)

I bought a 12Gig notebook drive from Computer Exchange, who I assume have
branches around the UK - they also have a web site. I paid ï¿½90 for it.

For your Falcon a 2 or 4Gig one will most likely be plenty, and will indeed
just plug straight in - make absolutely sure that you don't mis-plug it,
serious damage to your Falcon may result.

Since the new drive won't boot, you'll need to prepare a floppy disk, with a
suitable driver in its Auto folder. HDDriver is the one of choice. Once it's
run, and the Desktop appears, you can run the HDUtility prog from the same
floppy, and partition (NOT format!!!) the new drive to your requirements and
the limitations of your operating system.

HTH.

You should both download HPOptimizer from the MISC section of my web site. It has no problems with any partition or sector sizes, and will also handle long file names. There is a seperate version for MiNT users as well.

I would, however, strongly recommend backing up partitions before going near them with a defragger, having been bitten when the NVRAM on my CT2'd Falcon got chewed up half-way through optimising my C: drive. As for backup programs...

>Is there any mention in the attendant docs.

The source was released a few years back (long after the bbs scene
died); I've already given the URL to Joe. Does this imply there is
nolonger a registration possibility? Likely..

Anyone have a registration to share?

Joe: You're sure you can't hack it in the source? It was GFA,
shoudl be easy to hack up?

Theres also Fortress-ST and STadel (though STadel was weakest of
the bunch, it is free, source available in C, and the same as the other 30
or 40 varients of Citadel). I liked STKeep and Fortress in their day, so
maybe Fortress is worth looking at?

Maybe STadel is best, since it coudl network with all the other
citadels, and I'd bet there are at least a few citadels (cita88 standard
ow ahetever it was) still around. I know Cita/ux (unix, original port) is
still in use..

Hi,

I don't know about mem being expensive any more.

I just went and bought a 256mb Dimm obviously for my PC and it only cost
£50.

This wouldn't make a big harddisc but two of these should be sufficient and
they would be really fast in comparison.

Anyway, Would ther not be any way to be able to "Daisy-Chain" one of the
said devices and have a hard disc as well?

Or am I speaking out of my lower regions as normal?

And WHY exactly Linux sux so much? Cause its free? Capable? Fast?
Cause u cant get into it? or is there any special reason u hate it soo
much? Personaly i dont use Linux, even dont like it much, but its
definatley NOT a bad or sucky os.. I use MiNT, which is Unix/TOS merging
and i dont wana use any non UNIX os again.. And so what if it wont be
major contender.. look on the road, on 1000000 ford pintos came one
Ferrari, does it sucj then?

> Granted, Apple could be, and already is, a major contender in the desktop
> market, but never Linux. It's not just because of the narrowmindedness of
> Wintel users, it's simply because Linux is a system from the 70s.

Please be real... Its clear u really hate Linux... and if we dislike
OS-es, MacOS is the worst os, slow as hell, u need 1000 plugins to make it
usable, superbad memory managment etc... not to mention rebuliding the
desktop (what nonsense) which takes ages even on G3 etc etc...

U talk about narrowmindeness of Wintel users, do u think u really are
better?? Cite: "You're forgetting that Linux S U C K S. It really really
sucks..."

Yes Tim, one should be able to Daisy-Chain it. The SuperCharger has an extra
port to Daisy-Chain a hard drive, So there should be no problem having a
hard drive or 2 as well.

ICD made a similar device for the Atari 8-bits called the ICD Multi I/O (MIO).
There were 256k and 1meg versions. I have the 1 meg version and can setup
as many RamDisks as memory will allow, or just use one big one.
It really comes in handy, you can load programs into the RamDisk and run them.
I used it alot for ARCing and UNarcing files in memory. The MIO also has a 50 pin
hard drive connection, RS232, and Printer ports.

I wish the Falcon had a DMA port. Anyone know if the Falcon has the basic
hardware were one might setup a DMA port on it?

This is DRAM, and it's also 64(128?) bit and so would make it pointless on
Atari. You need a DRAM controller which IMO is difficult to make, maybe
not for someone else.

>This wouldn't make a big harddisc but two of these should be sufficient and

I have opened mine up and there is alot of space on the PB for adding the
SPECTRE GCR chips and etc for the GCR option. I've got docs here explaining
how to do the upgrade. Not sure about duplicating the Happy part, one
could probably do it, but the problem would be locating the special Happy
Chip(s), IIRC, these are specially programmed. One may be able to burn
a duplicate with a EPROM burner or similar.
Someone correct me if I'm wrong.

Hi,

The senario given by myself is no different than any of the other one's listed here,
All extra memory solutions going onto the DMA port would require a memory controller unless using that
serial memory type used on things such as the playstion (although I would think above 1mb you do).
From my understanding of this type is it is very slow, so maybe not much if any faster than a hard-disc.

So this is not a detremental fact for the product being acheived.

The memory is 64bit (I think) because it is a DIMM (Dual - Inline - Memory - Module) so in simple terms what I understand it to be is 2 fast 72pin simms.

I wasn't saying that it would be easy, I for one wouldn't know where to start. I know what it is, where to put it and where to buy it from but that is your lot sorry.

And another thing it would slow down your startup or take a long time to fill it up by hand it it was that size.
I think the Falcon can handle 1.2mb per sec. through it's SCSI bus, don't know what the others are off hand.

Tim Anderson.

At it's time Diamond Edge was a very good piece of work Now it's
absolete. One of the most dangerous drawbacks
most important drawback is that it can't handle long file names at all.
That's probably the cause of your trouble. Furthermore it can't handle large
partitions too (above 500MB?).

Alternative is optimize. Works good but a little bit dangerous as it
does it's job in memory. If your machine crashes during the action
you'll loose data.

I don't have problems under freeMiNT/N_AES using Ozk's scc.xdd.
Nor do I've problems when I use the common HSMODA drivers.

Source record: 45869

Hi all!

Just have to tell that MagiCNet works all fine now.
I have managed to use apps like aFTP, aMail etc
and several ported apps to MiNT/MiNTnet like ircii-2.8, mICQ, ftp, telnet,
tracerou.

Working hard to get GlueSTiK work. Seems that one must fool the system that
MiNT is present, like set the MiNT cookie somehow. There's no point to
binary
edit gluestik and change the MiNT sentance to MagX, then maybe the author
kick my ass. There should be a solution for this.

I use most apps through the u:\ drive and u:\etc\ is properly set.

Back to GlueSTiK, I'm a newbie there. I figured out that a file called
STIK_DIR.DAT should be present with a path to C:\STIK_CFG\ with the
file DEFAULT.CFG placed there. That's all?

Maybe I can't start GlueSTiK 'course I missed something?

TOS 2.6, actually TOS 2.06 is right name... works very well without
Blitter chip.

You can try it without opening Atari - there is software loader, which
loads & relocates TOS 2.06 in any ST(E) machine.

The Milan II was cancelled due to problems with the availability of a key
component, and because a re-design would have come too late on a now too
small market.

The Milan I is still available both with 68040 and with 68060 CPU.

>without
>the gfx card if I could get another one to work.

Without a supported card, the machine won't be able to boot at all. The
bootblobk (which does the hardware initialization before TOS is started)
needs to get the card up in VGA text mode, and unfortunately the procedure
to get there is chipset-specific and not well documented by the
manufacturers.

Getting the S3 Trio working was the work of several weeks ...

>Also how easy is it to upgrade the 040 in the Milan to the 060?

Provided the mainboard has up-to-date TOS, Bootblock and glue logic, you
simply remove the 040 from its socket and put the 68060-adapter-card with
the 68060 on top into the now empty socket. Otherwise, you need to upgrade
these first since an too-old TOS/Bootblock will not boot with the 060.

>(although one or two did have a problem, it's unlikely).

ISTR there were some games that wouldn't run with more than 520 kB
(or was it 1 MB?). There is a small PD program, FIGGY.PRG, which
lets you restrict the usable memory to 1/2, 1 or 2 MB though.

>If you want to see what's in it, then check out a program like Mark Baines

Very good proggy that, except that the sub-menus don't work on a
MagiCd Falcon :-(though this won't worry him on an STE.

>printed, as my 1st Word cannot find any files when asked to print them.

In WP mode 1st Word saves with stretch spaces (ASCII 29 and 30, I think) instead of the normal ASCII 32 spaces. But if you save the file with WP Mode switched off (unticked) in the Edit menu, you will get a standard ASCII file that should print fine from the desktop. (At least you do with 1st Word Plus - can't recall if it's there for the older PD 1st Word.)

But it's very strange that 1st Word can't find your saved files! Are you sure you have selected the correct path in the file selector for saving and again for printing? With floppy systems, it is better to run the program from floppy A:\ (and keep this write protected) but save documents to B: - TOS will prompt you to change disks when necessary. Try writing a short file and saving it to B:\ as TEST.DOC. When you select print (Control-U) straight after, the saved file should be preselected in the file selector and you only need to press OK. I taker it you have the correct printer driver loaded?

Are you using long filenames? The Diamond utilities won't handle
those. They also screw up with large partitions: I have some 840 MB
ones which give negative size numbers and won't show occupancy in
Edge. Wouldn't dream of trying to use the Diamond proggies on
them! Use the Shareware OPTIMIZER.PRG instead for defragging.

What sucks about it?
what's hard about it?
WHat's wrong with the desktop, and icons?
WHat's wrong with their filesystem, task schedulers, memory management?
Maybe you are mixing up the OS with the applications? maybe you should
know the difference unless you want to remain clueless. Now I am not
saying that you are clueless, just saying that because you don't give good
argument to your statement, so it is very hard to take you seriously.
Give me some good stuff here so we can all bash on linux, while more and
more people, while more and more companies are shifting to it.

Could you be mad because it took you 9 years to learn microsoft windows?
and now you see that linux is showing up as being a serious contender to
what you use?

> > Granted, Apple could be, and already is, a major contender in the desktop
> > market, but never Linux. It's not just because of the narrowmindedness of
> > Wintel users, it's simply because Linux is a system from the 70s.

what are you talking about? are you buying this all NT (new technology)
advertizement crap? As long as 'they say' that it is NEW and IMPROVED,
you'll believe them, (i guess you need some source of information and
advertizement is as good as anything else huh?)

Because it's old and STILL being used, doesn't that tell you something?
There's a very important rule everyone should know, you don't change a
winning team. If it has lived 30 years and still proven to work well, it
shows that the original design was just genious because it could adapt
very well through time. That's scalable, evolutive, flexible.
(here I am talking about unix in general, not linux per se).

PS: give me this 1959 LesPaul ANYTIME, after all it's old, the technology
since then has caught up, I'll trade you my 2001 Yamaha EX2300.
PS2: what????? they still make the LesPaul model????

A good design is a good design, can't deny that. Period.

STIK_DIR.DAT is for STiNG. I can't be used together with Gluestik.

You must have a dir called stik_cfg in de root of the bootdisk.
In that dir sits default.cfg which looks like this on my setup

ALLOCMEM = 300000
POP_HOST = pop.pandora.be
POP_USERNAME = my_username
POP_PASSWORD = my_secret_word
SMTP_HOST = smtp.pandora.be
FULLNAME = Martin Byttebier

Unless happy comps. released the specs or details of the custom chip,
you can't duplicate it. They haven't released notes for programmers that
I know of.

To add the upgrades, the docs that come normally come with it tell you
what you need and schematics, it is also possible to add a couple of
eprom from a cartridge and install it in the cartridge. This was many
aimed for the MAC chips so you can use it as an emulator!!

Well!!! yes you are right. a software version was produced that loaded
tos 2.06 from disk. BUT you don't get the full benefit you get on ROM,
and it eats up memory.

iirc the blitter shouldn't bother it to much, it should detect and
adjust for the blitter.

Well no. Both programs are commerical. They are still being sold
though. I have seen other programs that are downloadable from the net.
One is a bckup program that works with any SCSI tape drive.

Steve, do you know of any other cartridge eprom's one could put into the
Happy Cart, besides the GCR?

I've got a Spectre GCR cart with the Mac chips, I could probably put it
in the Happy but I'd like to try something else.

If there is some other interesting cart device that I could put into the
Happy, I'd be interested in hearing about it.

Some sort of Video or Audio Digitiser would be nice. I wonder if one could
fix a hardware RamDisk in it?

It would be cool to get it working on the Falcon! Have you ever tried it on
one?

actually, The iDiot Forever Known As Sinclap is an endangered
species, namely the Drooling Mac Zealot. Its species has since evolved
past it into somewhat more informed, tolerant creatures (indeed,
recently MacAddict magazine proclaimed people like Sinclap to be nothing
more than dinosaurs whose puffing and insult tactics in public forums
like c.s.a.st are an embarrassment and a detriment to Mac evangelism).
Even those in comp.sys.mac.advocacy who have made the rare glimpse of
Sinclap in that forum realize that it's a maroon, especially in light of
its recent pronouncement that all Macs that use a 680x0 processor are
"junk".

It could be possible that Sinclap may be doing its usual puffing and
bellowing in order to find a mate, since human females have rejected its
pathetic advances once they realized it had been disqualified from the
human race for shoving! :)

I propose that we set up a fund where Sinclap be tranquilized,
captured, tagged and set inside a proper enviroment where
anthropologists may observe its actions - like, let's say the Mac
section of CompUSA. Or even better yet, in a cage at this year's
Macworld Expo in New York, where higher evolved Mac Users may wonder at
how such a creature could exist without smothering on its own hot air,
or why this one didn't jump off a cliff in order to get away from the
imaginary "Atari Jihads" who were "out to get it".

I have a similar problem with my Yamaha CD-RW drive, which I posted here last week. No CD drivers can even see that my drive exists except for ExtenDOS (which is fine, since that's what I normally use, but wanted to try out the others). I've tried Spin with MetaDOS, CD-Lab, etc., and they all say the drive doesn't exist. Wierd!

I've also recently got another strange problem. I haven't done a whole lot of stuff with my drive, as I only have an old version of ExtenDOS, and haven't had the chance to send off for the newest version, and I can only read, not write with the drive because of this. But in my most recent experiments, I've noticed that while disks with CD-ROM data seem to work perfectly fine, *some* audio CD's have trouble. Fairly old audio CD's seem fine, newer ones are hit-and-miss (as in sometimes they work, sometimes not), and some of my newest ones completely lock-up the drive! The hit-and-miss CD's act like they are skipping, and suddenly the drive resets itself. With ones that have the most problems, either the drive says there's no disk, or part-way through the initialization process (when you first put in a disk), the drive freezes up, and I can't access it or even eject the CD. I have to put a pin in the "emergency eject" hole to get it out. Anyone have any ideas? I've got ExtenDOS 2.1, and a Yamaha CDW4416S CD-RW drive. Could my drive be bad? Could there be some new Audio CD format that the drive or driver can't understand? There's even a CD that has both audio and CD-ROM data, and I can get to the CD-ROM data fine, but only sometimes get the audio. Any help would be appreciated! Thanks!

Hi,

as a little modification of my last question...

What games for the ST with monochrome screen do you think had/have
the nicest graphics. Not necessarily trying to do dither photos
or something, but graphics that accept the monochrome display
and still look nice :)

The DIL sockets and the schematics look like you could drop other
cartridge program chips in them.

I don't think you'll get a digitiser or sampler chips in, as they
require extra ic support and hardware.

I would think something like backpak, possible the ultimate ripper OR
supermon, fast basic or any application type ic's.

I've tried the cartridge on the Mega STE but haven't tried the Falcon,
yet!

I got my hands on the top of the range one a few months ago, so that
leaves me with a couple of option 0's spare.

Modern drives use the energy stored in the "flywheel" of the spinning platter
to park the heads when you switch the drive off.

Mind you, I wonder how that works if you have a drive (like mine), which goes
into "sleep" mode when it hasn't been active for a time?

>June's payday u c. (mid June)

I'm in no hurry at all, I'll sell it for 25 ukp if that's better or a
trade. What items do you have, I'd much prefer a trade, as something
useless to me (the drive) is important to you, and something you feel
useless may be of good use for me. Atari stuff only though :)

Thanks

I think jonk was a bit unclear in his question about the video card.
He requested info on my hades, where apon I told him I got an older
gfx card from ebay for 10 USD for my hades. He is wanting a milan.

Jonk is wanting to know if he can buy the gfx card himself locally for a
milan? Or is there something special about it that would require you to
buy it from the dealer with the milan board?

If it can be gotten locally can someone provide the gfx cards exact
make and model?

He contacted woller who said they were out of video cards...

>Atari news? Sounds like misuse of the name..

Again, read an issue or two and you will understand. Show me the proof that
the magazine contains 99% non-Atari news. The members of our staff are Atari
users. The magazine is produced using an Atari Falcon. There is plenty of
Atari news - computing and gaming. The magazine is offered online, on Atari
sites. The magazine also contains technology news as well as other gaming
platform news. As was mentioned earlier, Atari users are not living in an
Atari cave - we do realize that there's a larger world out there with news and
technology that's interesting to read and learn about. Unlike you, apparently.

Source record: 45829

If there is anyone out there that is interested in this project
but does not wish to commit to a pledge please contact me.

I decided to add a category for interested users who would prefer
to wait and see the reuslts, via a demo program when it is available.
We need to know more accurately how many users really are interested
in this.

I personally have spent a considerable amount of time over the years
hacking at the '.GFA' format. It will take some work to get a new
Editor that can deal with tokenized files directly. So please
show your support.

Thank you for your time...

Hi Robert,

>I`m not sure Soundpool (CD-Recorder 2?) supports your CDRW.
>Drive is new.
Version 2 doesn't support the Yamaha 6416 but version 3.xx does, the
update can be obtained directly from SoundPool and costs 100DM. All
the Yamaha writers up to version 8824 are supported.

>Also CDRW 2100S isn`t found by Soundpool software.
Correct, but then this is a brandnew writer, which will probably be
supported when the next update is released. We should be gratefull
that SoundPool still updates CD Recorder Pro... they are one of the
very few that are still supporting this platform.

Cheers from Belgium

I have not knowingly had any problems with Diamond Edge. The only
time that I find lost clusters is when I check the NEWSie partition.
Since I turned the NEWSie logging function off as much as I can the
errors have diminished (but not gone away).

Diamond Back has also worked OK.

Hi Harry,

What kept you so long? I was wondering where you were.... :-)

>It is *entirely untrue* that Barrie does not make it clear that the
>keyboards are spanish.
Really?

<SNIP>
My price for (TT) Mega STE kbrd is $40 plus (2kgs) shipping,
standard
Atari gear.
<SNAP>

This advert instegated my reply, please explain me where Barrie makes it clear that these keyboards are spanish?
He did explain but only **after** I informed prospective customers about it. That's not really the same thing is it?
May I suggest to swallow your "entirely untrue" back in, I believe that "put a sock in it" is the right expression?

>I am completely fed up with the vendetta you and Steve are
>perpetuating based on one problem, whose validity seems to be a matter
>of conjecture depending on who you chose to believe.
Oh boohoo hoo...

>Recently I bought further hardware product from them that didn't work.
>They're hardly perfect. I could name a multitude of other products from
>other suppliers too. Would that make you happy?
I'm not interested at all in your dealings with SysSol.... have I ever said that they were perfect? Have I ever praised them or recommended them? Think very carefully before answering this... I might ask to proof it (learned this from Barrie).

>Dennis - put a sock in it or a get a life. I'm fed up of your noise on
>this subject (feel free to talk about anything and everything else).
You're making the noise, just like Dave you come here accusing me without verifying the facts, when asked when and where I made the alleged "noise" he answers fail or as in your pretty example simply are false. But we do know why the answers fail, don't we? Because the alleged noise was never made in the first place.

So you're fed up? it's people like you and Dave that force me to add to this thread. Did you really think that posting that your pretty "entirely

untrue" contribution would have gone unnoticed? If this is the best you
can do, then you better let this thread end....

Cheers from Belgium
Dennis

Hi,
DiamondEdge works very well and is a very useful program - but never for
larger partitions than 512MB!!!
If you work with partitions that aren't larger than 512MB, you'll be safe
with DE, since it really is a good program - but otherwise you can use
Ataris old CHKDSK3, which has worked with every HD I've tried it with - and
I'm sure there are other alternatives as well...

From: phantomm@bellsouth.net
Message-ID: <VhwP6.76$6i.3451@news1.atl>
Source record: 45819

I've used Diamond Edge without any problems for years on a number of different hard drives IDE/SCSI. I had no problems untill I put a 6.4Gig IDE hard drive in my Falcon. I setup all partitions except for the boot partition over 800megs. My boot partition is 220megs. The version of DI, i was using worked fine on the 220meg boot partition but would not work on the 800meg partitions.

I upgraded Diamond Edge to version 2.04 and this solved the problem. I can now DeFrag the 800meg partitions with no problems.

However I have ran into the LOST CLUSTERS problem and for me it is just about always on the Drive partition I use to store NET/WEB Software such as CAB, NEWSIE, AFTP, and etc.

For me the best solution was to put all the Net/Web software on one partition. And DeFrag it on a regular basis to cure the Lost Clusters problem.

It is also a very good Idea to have or make a large clear partition to copy files over from a partition that has alot of problems such as lost clusters before you use Diamond Edge to Fix it. This has saved me alot of lost data. And it will clearup alot of problems. Just re-copy the files back to the original partition and this we DeFrag and fix some problems.

While doing this you may find a file or folder that has a problem and cannot be deleted and you can use Diamond Edge or other software to fix it without risking messing up your good files.

Yeah, there are TOS extractors out there, done it myself. I think there is one included with TOSWIN or TOSBOX, one of those. I don't have a URL, sorry, I didn't like emulating :)

Diamond edge doesn't work with long file names & will definitely screw your
files on any partition using them. There is a utility bundled with Kobold
which seems ok but I haven't tried ot out completely.

Does it work under Mint ? I have never managed to figure out MintNet
so MagicNet might be the easiest option. ;-)

Just kidding really but if it is easy to install it could win friends
even on Mint.

Have you tried the Cab overlay with SSL ?

Yes, it can be done - but not on a PC which can't read the disk. I used to use Harlekin's memory mode to do it and, darnme, I can't remember what you have to change it to. I must research further. Or someone with a better memory will come up trumps shortly.

Charles.

MiNT has at least got some pieces of TOS, which makes it a non-UNIX of sorts.
With MiNT, you really don't have to get into the UNIX stuff at all, that's
only if you add some BSD environment distribution.
And why would I dislike anything which is free, capable or fast? But could one
really say that Linux is fast? What I don't like about Linux is the fact that
it is big and hard.

I've got more computer architectures within 10 metres of reach than I could
even care to count. I've used lots of platforms, but really, why Linux?
Certainly, it may fit you, the programmer type or the polytechnic student, but
for the people who don't program much or care much for OS design, it is
worthless. Even I, a computer nerd, fail to see the point of it.

>programs with an emulator?

Goto http://lgd.fatal-design.com and download the image of the TOS version that is in your Mega ST (Probably 1.02 or 1.04). It will be easier...I believe their is also a link to the program that will extract a TOS image somewhere on that site.

6709. FS/T: Atari An Introduction to Sound and Music

Newsgroup: comp.sys.atari.st
Date: 2001-05-26 01:11:55 UTC
From: main@appstate.edu
Message-ID: <cbbf4eff.0105251711.2052f0e8@posting.google.com>
Source record: 45842

I have Atari's Introduction to Sound and Music availavle for sale ot trade.

This item comes with the original box, manuals, and disk and cartridge.

The cartridge plugs into the side port on the ST and allows it to digitize audio samples.

Music Master and Music Maker Plus let you compose, edit and listen to music

Sample Master allows you to capture sdamples on the cartridge and play and edit them.

I am interested in trading either Lego, Atari 8-bit games with manuals, or Atari ST games with manuals. Make me an offer and send it to main@appstate.edu

Thanks.

Source record: 45844

Hi !

Gill Bates wrote on Thu, 24 May 2001 :-

>anyone still waiting for stuff or having problems ??

Yep ! YEp ! YEP !!!..Alas,read on !

I have been waiting almost 10 months to get a 14Mb board from that guy. I paid 25 quid and was sent a board that did not work.Two independant PC engineers assured me that the 14Mb board that he sent me was not 14Mb but a 4Mb. I returned the board to Titan/Cortex with a snail mail covering note, and also an e-mail. Mr David Encil claimed that he had not received the board back, and did not know what my problem was.

E-mails have flown back and forth between myself and Core Designs arguing the toss over this for some time.I threatened Core/Titan with 'small claims' court action , and the fact that I would post my experience on the news groups. This did produce a reaction from Cortex/Titan following which :-

On Tue, 27 Mar 2001, I had a communication from Titan/Cortex telling me that My replacement board would be posted by the end of the week.This was then followed by another e-mail from Titan/Cortex apologising for the delay in sending the replacement board due to pressure of work.

Of course it has never arrived ! We are now nearing June, and shortly a year will have passed with no satisfaction from Cortex (as David now prefers to be known).

As a matter of interest, in the meantime I purchased a 14Mb 60ns Simms board from AUT which advertises in Micro Mart here in the UK. I paid them 16 quid for the board as opposed to the 25 quid that Cortex charged for a duff board.Is there a moral in this story I ask myself ?

(Incidentally - and nothing to do with Cortex as far as I am aware ,I note that on occasion some members of this group look for internal Falcon IDE drives, and I have noted silly prices being asked.
Not many months ago I replaced my internal 2.5" IDE with a Toshiba 1 gigabyte unit designated as the MK 1002 MAV.
It works brilliantly. It was brand new .No modifications were needed to fit it,and it cost just 39 quid + vat from AUT. It was listed under " 2.5 inch Notebook Drives".)

I once considered Titan/Cortex to be a good supporter of the Atari.In the past I bought a number of items from them. Now I would avoid doing any business with Cortex. I have very good personal reasons not to trust

that firm. If you have placed an order with Cortex then be very wary,
and make sure that you keep records of every receipt and communication
as I have done. I wish you luck !

I have taken considerable time in preparing this posting to be sure
that I have not included anything that is not untrue,slanderous,or
libellous concerning Titan/Cortex/Mr David Encil. I have posted the facts
as they are.

I have retained, and can produce, all mails between myself and Titan/Cortex
concerning this matter,and it grieves me that it should be necessary
to post this experience that I have had with Cortex to this newsgroup.

Regards,

~ Paul ~

they are all unix clones.
Are you expecting someone to clone mswindows maybe?

>

what?????
hm for your knowledge, you really should try gnome.
Or if windows really is your kind of desktop, maybe try kde, you'll feel
right at home.

>
> >WHat's wrong with their filesystem, task schedulers, memory management?
>
> The filesystem is horrible. It falls over when you blow at it.

right, and fat16 is even better! or ever ntfs, or fat32. right?
XFS, ext2fs are quite nice, speedy and quite reliable. Hell xfs has been
used for years in production environments. (journaling fs is quite
important), but well maybe you think atari TOS FAT fs is sturdier?

hmm I am now puzzled, if mswindows has "more efficient GUIs etc" why
aren't you using it? what are you indeed using??

>
> >and now you see that linux is showing up as being a serious contender to

> And UNIX is a designer's nightmare. Come on, this is the 2000s, and you still
> run a monolith kernel?

once again, VERY confusing, probably coz you don't make much sense.
designer's nightmare:
1) not EVERYONE is a designer.
2) actually unix is one of the most flexible OS you can get, which is a
sweet thing for designers for a new project.
3) do you know how many people, companies are still buying aix machines?
or solaris, hpux and dell servers for linux. Hell even mainframes are
going quite strong with linux as a host OS. What are ALL these people

thinking. You need to tell them that they are all doing a mistake, they all should buy macos or windows (or whatever you use). Unix is dead and YOU know it, actually you are probably the only one knowing it, it is your role to enlighten us, poor techies.

What are you actually using? what do you actually think should be the world's OS?

6714. Milan Motherboards

Date: 2001-05-26 05:20:13 UTC
From: Christopher Friend <rangerfiendNS@NSyahoo.com>
Message-ID: <tgufak49u5oed7@corp.supernews.com>
Source record: 45749

Does anyone know where I could obtain a Milan 040 or 060 motherboard in the US and what the appox. cost would be? and do these motherboards have a standard AT/ATX footprint for placement into a PC tower case?

Board doesn't need RAM - Just the processor installed.

Chris

6715. Keyboard calls to ACCs

Newsgroup: comp.sys.atari.st
Date: 2001-05-26 05:54:31 UTC
From: george@moulder77.freeserve.co.uk
Message-ID: <9engeneqr1@newsg4.svr.pol.co.uk>
Source record: 45750

I have been looking for a program which will call a desk-accessory
from the keyboard, and have been trying

DC DESKEY by Michael Vederman V1.0(Beta) of 1988
(an accessory of 5164 bytes)

Surprisingly for its age it works reasonably well on TOS 1.62 with a
multitude of other programs loaded, but the documentation has a
apparent warning that it uses an 'accessory handler', and from my
short experience with it, I am wondering whether this produces
something resident which requires a cold-reset to clear when
accessories are changed. Can anyone enlighten me on this?

Trying to find a later, non-beta, version of this program, it appears
that even the Atari archive at the University of Michigan, which has a
large list of DC software, doesn't have this accessory at all; and the
Fast Club only has the one I already mention, the beta version, in its
collection.

Can anyone help me with a later non-beta version, or suggest a similar
SMALL program that would do the same job? There is only ONE
particular accessory that I wish to be able to call from the keyboard.

Hi all!

Barrie has replied to my message but didn't post it here. I therefore
quote him in full without changing anything.

>Hello hasnone, join the club.

Oh, so now you are insulting me too?

>> Not as childish as Barrie calling Sean Barbieri "barbie doll", Steve Sweet
>> "sweat", and Dennis Vermeire "vermin"

>not worth upper case.

Why you have to change my post I don't know.

>> This more than anything, has got my back up about this sorry person. Why
>> he has to insult all the other people who happen to have the same family
>> names that go back centuries as Sean, Dennis and Steve, I'll never know.

>Who's rattled your cage?

You have Barrie.

>It is plain to see who started the insults.
>Any one who publishes the utter and complete rubbish your mates
>have in a concerted effort to close me down deserves all the retaliation
>they get.

I think the sheer fact that you have been downright rude to lots of people
(even to those who haven't been rude to you first, like me), means that
you've just lost a lot of business. People won't take their business to
someone who they think might not respect them.

>Ponder this. barby is the only complainer to surface in response to my
>open request for any more complaints. No trading standards enquiries, just
>the whinging of a customer who didn't get his own way and screwed a good
>deal. Several years ago to boot!
>Have you actually met barby or vermin? Seen their ' evidence ?'
>I suppose you haven't seen any posts supporting Keychange......
>vermin claims to have evidence he won't reveal.
>Do you have any evidence?
>sweat seems preoccupied with ladies of the night,
>
>You keep strange company at your club.....if it's full of more
>self-opinionated old women
>like you you're welcome to it.

Hmmm, the Cheshunt Computer Club has given more support to the Atari community over the years than you've ever done. Old women support a community better than someone who is just interested in making money from them and not helping people.

James

Cheers!

> MiNT has at least got some pieces of TOS, which makes it a non-UNIX of sorts.
> With MiNT, you really don't have to get into the UNIX stuff at all, that's
> only if you add some BSD environment distribution.

Yes, i like GEM, but also i like MiNT Unix part. which is now moved from
BSD to more linux like (systemV maybe) fashion, to be easier to port apps
etc.. I do refer to MiNT as kernel WITH Unix part as well... Of course i
do not run X but AES on console... (with CLI virtual consoles)

> And why would I dislike anything which is free, capable or fast? But could one
> really say that Linux is fast? What I don't like about Linux is the fact that
> it is big and hard.

Linux IS fast! I use server which run on 486 machine and since it dont
have a lot of users its VERY neat.. Also it aint big, distributions are
big, they contain all u can get, but thats way too much.. Look on windoze
what u get on 2-3CD's, a lot LESS (cause os and apps are enormous) as on 3
Linux CD's... And u shouldnt mix or equal Linux with all GUI's available
for it!! Gnome is big and slow, but that is NOT Linux, its GUI ported for
Linux, one of many.. MiNT analogy would be NAES and AES4.1... U do dont
wana use AES 4.1. U can get nice Linux setup, used for server maybe (i use
MiNT server) etc on small space!

> Etc etc, but at least it is consistent and easy to use.

Consistent it aint.. It is very touchy and prone to crashes, rebuilding
deskops are touchy, also creator bits realy limit the user, like dclicking
on jpg created by photoshop will load photoshop.. so to customize it,
takes time, lotsa pluggins and knowledge where to get them and how to use
it..

> I've got more computer architectures within 10 metres of reach than I could
> even care to count. I've used lots of platforms, but really, why Linux?

And why not? I see u have own mind and wont accept other opinions still
i will try: why i love Unix is its CLI (command line interpreter) which is
very powerfull tool, in lotsa cases way more powerfull as GUI, but i wont
make myself stupid and dont agree that also GUI is good in other cases..

> Certainly, it may fit you, the programmer type or the polytechnic student, but
> for the people who don't program much or care much for OS design, it is
> worthless. Even I, a computer nerd, fail to see the point of it.

Well u see, im actualy a wellder.. I work with metals and in our
workshoop u will not see a computer at all. I went to metalurgic school

and computers are my hobby from 1980..

To make my point: i like MiNT, i dont like as u can see MacOS, Amiga OS looks weird to me (dont interpret that as bad), windows are cramy, but i do not use vocabulary u do.. Like SUCKS, CRAP etc....

> Gå med i SUGA, Swedish Usergroup of Amiga!
> WWW: http://swedish.usergroup.amiga.tm/
> BBS: 08-6582572, telnet://sua.ath.cx:42512

Im sorry for this, but u Amiga owners are always damn offensive to other stuffs... if i had a fight with computer owner, with calling names etc, is in 99% Amiga owner... Is that a complex or what... And i should mention that i also have friends and know cool Amiga ppl

UNix filesystems are best filesystems... Reading all ur answers u have already done the verdict, aproach to Unix as hard, useless, obsolete (yes all instituts ets runs it), etc and dont even dare/care to read docs and learn 1-2h (without prejudices), thats all u need to start using Unix..

Unix filesystem are prone to crashes, fast, no need for defragmentation.. Also machines with uptimes from 1 year and more, up to 10yrs are Unix servers, constantly used by a lot of ppl etc and still up and runing!

> Hardly. MS Windows is a sad, inefficient of other, more efficient GUIs, and
> requires no time to learn. FYI, I don't run any Windows machines.

So what? And that makes u good? Or smart? I do not care what OS/Machine ppl use... i care about person BEHIND the machine... its aint computer guilt for your stupid replys here.....

> It has never scaled down to the desktop, which is what I'm referring to.

Why it should be... One of reasons for Unix success is modularity and a lot of addons, servers apps etc.. Now strip all that to desktop and what u got?

> And UNIX is a designer's nightmare. Come on, this is the 2000s, and you still
> run a monolith kernel?

Exactly, and all big organisations runs Unix, your post pass mainly Unix servers to reach us... All major companies, reserach labs etc use Unix.. clearly they are all stupid and obsolete.. What they should use? Windows? AmigaOS, GEM? Internet, and all about communications is Unix!! Some end stations runs on NT or others, core is Unix and also all

net, internet, comms etc stuff is developed on unix.. later same apps appear on other machines...

Hi Jo Even,

>I can confirm that this is Dennis' correct address, other than that I
>won't have anything to do with this rather silly thread...
I agree that this thread is taking on silly proportions, and I also realise that I'm partial responsible for this but one can't always keep it under control. Remember the "silly" argument you've had with Woller about N.AES a while back ? Except for the verbal abuse and buckets full of sh*t, it was pretty much about the same thing....

Threads like these do serve a purpose, without having to choose a side, people following these threads should get a pretty good idea about the attitude and policy of the dealer(s) involved. If we don't stand up against these people they'll just walk all over us... I'm not going to let a crook walk all over *me* :-/

Cheers from Belgium
Dennis

>into "sleep" mode when it hasn't been active for a time?

I think when it does this it does actually park the drive. This drive
never had a sleep mode though, unless it was after quite a long time.

Hi

Just wondered if anyone else experiences simialr problems when printing on an accelerated Falcon. I have a Phantom (like Nemesis, Centurbo 1) and if I print in "turbo" mode I get a lot of rubbish printed. However if I print with Imagecopy or Papyrus (using their own built in drivers) it prints. The only way to print with NVDI is to switch off the turbo mode and it then prints flawlessly.

Just as a check, I switched on turbo mode and printed to an image, and when displayed in Imagecopy it looked fine. Seems like NVDI can handle the accelerated bus. Does the Nemesis give similar problems, the only thing I can see it is the Yamaha chip going too fast (if the clock is divided from system clock). It's annoying as Imagecopy can print in turbo mode, so why not NVDI?

Thanks

Lyndon Amsdon

From: Michael and Nicole Freeman <nameerf@flash.net>
Date: Fri, 25 May 2001 01:46:09 GMT

Hi Michael,

>I have a similar problem with my Yamaha CD-RW drive, which I posted here
>last week.
Sorry for jumping in this late, but last week I've had my hands full here
replying to silly mails, as you've probably noticed ;-)

>I have a similar problem with my Yamaha CD-RW drive, which I posted here
>last week. No CD drivers can even see that my drive exists except for
>ExtenDOS (which is fine, since that's what I normally use, but wanted to
>try out the others). I've tried Spin with MetaDOS, CD-Lab, etc., and they
>all say the drive doesn't exist. Wierd!
CD-R drivers like MetaDOS are getting on a bit, meaning that SCSI-3/MMC
compliant devices like the Yamaha rewriters are not recognised when used
with the normal *.bos drivers. SoundPool supplies a scsi_cd.bos that allows
using these devices under MetaDos/SPIN! compatible drivers, ExtenDos uses
a custom *.bos file which supports the Yamaha rewriters, hence it's been
recognised...
CD Lab doesn't need a CD driver, but SCSIDRV support must be activated in
HDDriver, (activate SCSI generic driver), if you don't use HDDriver then
you must install the SCSIDRV app seperately (see the CD LAB docs). This
tool is part of the CBHD harddiskdriver and can be downloaded from the
Belgian Chapelie ftp server...

>I haven't done a whole lot of stuff with my drive, as I only have an old
>version of ExtenDOS, and haven't had the chance to send off for the newest
>version, and I can only read, not write with the drive because of this.
Correct me if I'm wrong.... but I've had the impression that ExtenDOS is a
CD-R driver, the program doesn't allow you to burn CD's, to burn CD's you
need to get an ExtenDOS compatible program like Anodyne CD Writer? I don't
know this for sure since I use the SoundPool package....

>I've got ExtenDOS 2.1, and a Yamaha CDW4416S CD-RW drive. Could my drive
>be bad? Could there be some new Audio CD format that the drive or driver
>can't understand?
IIRC the Yamaha CDW4416 has a bug in it's firmware that causes this, it's
fixed (workaround) in the SoundPool scsi_cd.bos driver and probably also in
newer versions of the ExtenDOS *.bos drivers... so get an update :-)

>There's even a CD that has both audio and CD-ROM data, and I can get to
>the CD-ROM data fine, but only sometimes get the audio. Any help would be
>appreciated! Thanks!
This is the so called CD-Extra format or Mixed Mode format, Yamaha writers

support these formats, when problems are encountered this is due to using an out of date *.bos file, using the latest update of ExtenDos should fix this...

Cheers from Belgium
Dennis

>Ponder further. The customers who know me personally will realise what a
>worthless bunch of wittering old women you are.

Did you know that the Cheshunt Computer Club include Derryck Croker and Peter West who have translated more German software into English than anyone else. Not to mention the dozens of beginners we've helped get online, do wordprocessing, solve problems, etc etc etc.

That's part of why the Cheshunt Computer Club has done more for this community than you have ever done.

The wider Atari community aren't like the musicians who are only interested in Atari computers if they can run Cubase, and don't want to know about the rest of the potential in these computers. IE they don't know any better and you can get away with selling Spanish keyboards to them at inflated prices etc.

Cheers!

James

Fire with fire, matey. You seem as daft as your mates.

> >> Not as childish as Barrie calling Sean Barbieri "barbie doll", Steve
Sweet
> >> "sweat", and Dennis Vermeire "vermin"
>
> >not worth upper case.

Childish??? Have you read some, or indeed any, of sweats' posts?
>
> Why you have to change my post I don't know.

That's the point, you know nothing, you just repeat tittle tattle.
>
> >> This more than anything, has got my back up about this sorry person.

So who's into insults now? I'm not in the least ' sorry '.

>> Why he has to insult all the other people who happen to have the same
family
> >> names that go back centuries as Sean, Dennis and Steve, I'll never
know.
>
> >Who's rattled your cage?
>
> You have Barrie.
>
> >It is plain to see who started the insults.
> >Any one who publishes the utter and complete rubbish your mates
> >have in a concerted effort to close me down deserves all the retaliation
> >they get.

> I think the sheer fact that you have been downright rude...

Oop north it's called plain speaking, something your bunch know precious
little about.
Your use of ' abuse ' and ' rude ' seem to be catch-all terms for any
opinion you disagree with.

Care to comment on vermin and sweats' unfounded allegations or is that
against club rules?
You have proven, first hand knowledge of the facts? No, I thought not.

> you've just lost a lot of business.

You mean the stuff sweat can't fix for free? The newsgroup is the loser.

> People won't take their business to someone who they think might not
respect them.

People respect a good deal and straight talking, every one of my customers
has
spoken to me personally and discussed their needs.

None of your little gang have even met me, vermin publishes libellous
statements
about Keychange, sweat abuses my appearance with his ' lamb chop,
Noddy Holder ' comments so don't you even DARE to lecture me about abuse.
>
> >Ponder this. barby is the only complainer to surface in response to my
> >open request for any more complaints. No trading standards enquiries,
just
> >the whinging of a customer who didn't get his own way and screwed a good
> >deal. Several years ago to boot!
> >Have you actually met barby or vermin? Seen their ' evidence ' first
hand?
> >I suppose you haven't seen any posts supporting Keychange......
> >vermin claims to have evidence he won't reveal.
> >Do you have any evidence?
> >sweat seems preoccupied with ladies of the night,
> >
> >You keep strange company at your club.....if it's full of more
> >self-opinionated old women like you you're welcome to it.
>
> Hmmm, the Cheshunt Computer Club has given more support to the Atari
> community over the years than you've ever done.

Again, you just don't know what support Keychange has provided.
Where do you think the last 100 copies of Cubase v3.1 came from?
It took me 3 months of emailing and cajoling Steinberg to get some more
produced.
What have you done recently that's worthwhile?

> Old women support a community better than someone who is just
> interested in making money from them and not helping people.

Again, you personally know nothing about Keychange or the assistance
I give, but since sweat does your repairs for free......

Barrie at Keychange. www.keychange.co.uk

6734. Problem: TT030, SLM 804, and DynaCADD

Newsgroup: comp.sys.atari.st
Date: 2001-05-26 13:36:42 UTC
From: Veronica Coats <rccola@ctos.com>
Message-ID: <3B0FB169.C05A1204@ctos.com>
Source record: 45767

If you wish to reply by email, do not use the email address displayed in this message header. I am typing this on a friend's computer. Public replies here are preferred, but if you do wish to send email, please reply to wordworks@greeleynet.com with a cc: to kspringer3@excite.com. I can always access one of those email accounts when I'm traveling.

My TT030 (42 megs RAM) has seen very little use over the last 4 years. I'm now trying to set it up and make it useable from a practical sense. This means productive uses, no games. <G>

I use Xboot to choose different desktops. It is slightly munged, but works. (I can't add new configurations. I have the disk, just haven't dug it out to reinstall, but I don't believe Xboot is the source of my problem.) I usually run Geneva 006 w/ NVDI, but in this case I need to have a DynaCADD configuration, as Geneva and DynaCADD have problems with each other.

So I set up a bare bones DynaCADD configuration. The current problem is the 804 is not being detected. I'm sure it's a set up problem during boot up, as the printer works fine under Geneva/NVDI and printing from Papyrus 5.15.

Only 3 ACCs are installed: Diablo 630, XControl, and Edith. TThigh resolution, for those who are interested, but that shouldn't be the problem.

I'm open for suggestions as to what to change. It's amazing what you can forget in just 4 years. :-(

Ken Springer

I've run UNIX in various forms for years. As long as I'm not the
administrator, and it's through a terminal of some kind, it can even be a
pleasurable experience. Not so on a desktop.

> Unix filesystem are prone to crashes, fast, no need for
>defragmentation.. Also machines with uptimes from 1 year and more, up to

You assumed that I was a Windows luser, I rebouted that. Happy?

>> It has never scaled down to the desktop, which is what I'm referring to.

> Why it should be... One of reasons for Unix success is modularity and a
>lot of addons, servers apps etc.. Now strip all that to desktop and what u
>got?

But then you've already got my point and we need not further discuss this! I
couldn't care less about what's run on servers or workstations, but servers
and workstations are only a fraction of all computers in the world and are not
in direct competition with desktop systems like Mac, Windows or TOS!

>> And UNIX is a designer's nightmare. Come on, this is the 2000s, and you
>> still run a monolith kernel?

>Unix!! Some end stations runs on NT or others, core is Unix and also all
>net, internet, comms etc stuff is developed on unix.. later same apps
>appear on other machines...

Once again, I don't care about the bloody servers! We even run a UNIX server
at our usergroup, but that was never the topic in this thread!
You should read the entire thread before jumping in, since you're obviously
unable to put things into context!

>what are you talking about? are you talking about applications? or the
>desktop itself?

It's a multiuser system from a DEC mini, and it still has a lot of mannerisms
from that era. Multiuser systems usually have quite a competent administrator.

Desktops hardly have an administrator at all.

>> >A good design is a good design, can't deny that. Period.

>once again, VERY confusing, probably coz you don't make much sense.
>designer's nightmare:
>1) not EVERYONE is a designer.

No, so the good design argument is irrelevant.

>2) actually unix is one of the most flexible OS you can get, which is a
>sweet thing for designers for a new project.

My experience with UNIX has been quite the opposite. It is inflexible in every
way not related to pipes and shells.
OTOH, it is a rather nice system for programmers.

>3) do you know how many people, companies are still buying aix machines?
>or solaris, hpux and dell servers for linux. Hell even mainframes are

Why is it that everyone is stating examples of hordes of people using UNIX on
mainframes, minis or servers, when the original argument concerned the desktop
market?

>What are you actually using? what do you actually think should be the
>world's OS?

I don't believe that any particular OS should reign. To each his own.

There is probably no OS more consistent than MacOS. Compare a dozen Mac
programs, then a dozen X programs. The X programs will be disparate in most
every way, unless they conform to one of /several/ new "standard" toolkits.
Why would the creator bit limit the user? I fail to gewt what you're grasping
at.

I hate the UNIX CLI, since it's unfriendly to the extreme. All commands are called "blf", "srn", "tr" or "bn". Then you pass arguments using such easy-to-understand statements like "-n", "-Fr" or "zxvf". I love CLIs, I use them all day long, but the UNIX version of CLI makes it rather apparent why the CLI is very marginalised in today's world.

>> Certainly, it may fit you, the programmer type or the polytechnic student,

> To make my point: i like MiNT, i dont like as u can see MacOS, Amiga OS
>looks weird to me (dont interpret that as bad), windows are cramy, but i
>do not use vocabulary u do.. Like SUCKS, CRAP etc....

I'd be a lot more open WRT MacOS if it had a CLI, because it's a perfect example of how a GUI should be designed, only the underlying OS is horrid. Windows is not as neat a GUI, whereas the CLI is ridiculous. And UNIX is too complicated and unfriendly.

Two I know of (national, not sure):

Atlantic.net 1-800-921-9328
Earthlink.net 1-800-327-8454

However I'm having out-going mail problems (over 30k) with Earthlink
which maybe local in nature! Also, some can't connect with Stik but can
with Sting (both ok here).

>
> Regards, /Peter/

Switching drives between "A" and "B" (on my single MASTER-3S system)
on the ITEM SELECTOR screen whenever 1st Word does not show the
names of data disk files does seem to have solved that problem.

I have renamed my to-be-printed data files to end with ".DOC",
since often my 1st Word will show only those names on the directory,
though at times it shows names of all files.

As for 1st Word not being able to find files when I ask it to print
them, I remembered that for a single-drive system, we are supposed to
copy the file for the print program onto each data disk. Maybe(?) because
I did that, my 1st Word is now finding files when I ask it to print them.

Thanks for the help.

You may have a later version of 1st Word. Mine dates from 1986,
and does not give such a warning message about ASCII. Thanks for
the information about how to get TOS to show and print blanks.

> However you should still be able to print from within the program, when you
> have a file open try selecting "Print Current" from one of the menus this
> option should print the currently displayed file.

My 1986 1st Word does not have "Print Current", I think.

> Have you set up the Printer Driver?.

Yes, and it seems to work fine, once 1st Word has found the file.

> What exactly do you mean when you say it cannot find any files when asked to
> print them, do you mean that they are not displayed in the file selector?,
> if so are you sure that the file selector is pointing to the same directory
> that your files are stored in?.

>
> Stephen Moss

Usually the names would not appear on the file selector.
After typing-in the name of the file to be printed,
I was getting the message <<This application can't find the
folder or file you just tried to access>>. Maybe(?) it was looking
for the print program, which I had neglected to copy onto all my
data disks, after I had to go back to a single-drive system. This
problem has not happened since I copied that program onto each disk.
I don't know the answer to your last question; it may well indicate
the problem 1st Word has in getting data from the Master-3S.
As I've mentioned in another May 26 response in this thread,
the problems seemed mostly solved, for now.

Thanks

Yes, I am using legal filenames. In that parenthetical comment,
I meant the blanks in the data file itself, not in its name.
I think a few changes have mostly fixed my problems, for now.
See my response to the other threads of the same name. For some
reason, responses to my original message showed-up on new threads.

>have a DynaCADD configuration, as Geneva and DynaCADD have problems with
>each other.

I use MagIC 4.10 and DynaCadd will not run under Multitasking so I run
it as a single application under MagIC and all is well. FYI I also use
NVDI and EASE for desktop, I have a 804 but stopped using it sometime
ago as it was ghost printing and I couldn't figure out the problem.
I'm using a Epson Stylus 600. If Geneva will run a APP as a single
that should solve DynaCadd's problem....

Donner.......

ghosting is caused when the wiper blade in the drum unit starts decompsing/yellowing and isnt able to wipe the waist toner off the drum effectivly anymore. Mine dose the same, im uncertain if you can get replacment wiperblades, maybe from toner remanufactring companys. certainly a whole new drum kit is too expencive to worry about. If you have a SLM 804 with a good drum kit, consider yourself lucky, and its nout going to last much longer :)

Note that in current versions of HDDRIVER the SCSI driver is always
activated, i. e. it cannot be switched off anymore. This is because
HDDRIVER internally also uses this driver.

> You really have surpassed yourself with your verbal crap.

Im scene kid, and we usualy also didnt count midi musicians as kinda part of Atari scene and true Atari lovers... But they are ATARI users and in this bad times (well lets call them that way, altough eil2 party was amazing, with amazing prods) they show one view of Ataris we usualy forget:

MIDI ppl still use ST's for professional purposes, even more, some pure MIDI musicians went back to ST from other, because it has best synchronisation, its compact and VERY VERY stable.. So little machine from 85, is still in professional usage and seems to stay there.. VERY good result especialy if we know those machines are unmodified! I dont know any other machine with that record, and time usualy show true quality of machine.. Musicians aint die hard Atarians, they use what they find best..

Janez

P.S.: On Discovery channel they showed some astronaut training facility and also free fall research plane (that was 2yrs back).. Well inside that plane there are 2 ST's with SM 124 monitors :)

XBoot has a Y2K bug, which is the cause of this particular problem AIUI. There
have been some patches for it around, perhaps someone here can help you with
one.

Try using the iPRN driver (IIRC there's a demo version on either the NVDI or
MagiC master disks). It's also worth experimenting with alternative outputs
where offered, ie direct or via the BIOS.

I also had a result with GEMSpooler, but the iPRN solution's better IMO.

>though at times it shows names of all files.

If the file selector is called with a mask (ie *.DOC), then it will only
display files which match that. Clearing the mask and entering *.* will show
all the files on the disk.

Work with the programs you use, if they like data files with a particular
extension then use it, makes life much easier, and you will be able to tell
which are data files and which are not.

Moving away from BSD is a mistake, as FreeMiNT developpers will
eventually realize... probably too late to correct it.

The reference implementations of IPv6 and DHCP (just to mention
these two) are created first on BSD and there is where most of
the ongoing development on modern standards being done, mostly in
Japan where the shortage of IP addresses is already a problem
and BSD's are the platform of choice not Linux.

Correctly supporting BPF would unlock _most_ networking problems,
allowing MiNT to be considered a BSD variant with "configure".

Maybe people should also remember that Eric Smith based MiNT upon
BSD principles, not System V.

> Linux IS fast! Also it aint big, distributions are big,
> they contain all u can get, but thats way too much..

OpenBSD: 74mb for the base distribution.
Debian: 200mb for the "essential" packages.

I'm amazed at the elitist attitude some people in this group have.I have had contact with Barrie and found him to be a fair guy trying to make a buisness dealing in Atari products (something that isn't too common these days).You can't complain about prices as every dealer I've seen charges more than you can get the bits for second-hand.As for free repairs,well if you've got a mate who's a mechanic who fixes your car for free all well and good.But you wouldn't expect every garage to show the same courtesy.

You guys at the Cheshunt club are obviously doing your best to maintain the Atari presence in any way you can but the way your little group band together make you look more like the Atari mafia.

Chris Thorley.

Source record: 45704
Cross-posted to: comp.sys.atari.st,sfnet.atk.atari,fr.comp.sys.atari

I'm selling my second TT030. Specs:

* TOS 3.06 US (plus US keyboard)
* 4mb ST-RAM
* 48mb hard-disk
* internal 56K modem (Canada/US standard - may work elsewhere)
* installed: HD-Driver 5.13, NVDI 4.11, MiNT 1.15.5, N.AES 2.0.

I would preferably sell within EU (easier and cheaper to ship
and to collect the payment), but offers from everywhere will
be given due consideration.

If you are interrested, visit http://pp.fishpool.fi/~q-funk/
for the details and my correct reply address.

Hello all,

I downloaded the big LBC file and have been looking at all the programs/files. I managed to get them all working except for two. Of course they are in German and I cannot read/understand that too well. One is ATmenu which puts an Atari fugi logo in the upper left hand corner of the screen. I know that when you click on it you are suppose to get a drop menu of something. Has anyone figured out how to create/load a data file so that something appears in the menu? The other program is the one called Gaston. Just was is it? Thanks for any help...

Well u know my reply on that ;)... It is free, and current developers choosed this way... Im not in position to judge that.. they have their reasons and i respect that... And im not at all BSD/Linux patriote.. Fights about Debian/Redhat or Linux/BSD looks quite silly to me to be honest...

And on end, there is no "barrier" that unhappy ppl make own distribution based on prefered system... Users can decide then... There is already SpareMiNT, Debian in start, so noone stops u to make BSD MiNT....

> The reference implementations of IPv6 and DHCP (just to mention

Well tbh, im not Japan fan.. im not to conviced all from there is modern, but thats not the issue.. I do consider BSD good thing, but as i said, im not exatly patrotic toward BSD or Linux.. noone of those feed my mouth...

> Correctly supporting BPF would unlock _most_ networking problems,

Yes, but also u should remeber: After Eric Smith quited, there was few empty years, noone did vrutaly nothing.. After current crew took over, a LOT, i mean A LOT was done.. we never had such reliable system, so much good and current apps to choose from.. so its not all that bad, is it??

> OpenBSD: 74mb for the base distribution.
> Debian: 200mb for the "essential" packages.

Thats not exactly correct.. It depends what packager choose to use as base... it could be as low as 10-20mb as well...

You must create a dir called atmenu on the root of your bootdisk. In
there you can place everything what you like. Every entry in that dir
will then be listed in the popupmenu. It's a similar function as the
Apple menu on MacOS. You can start application from there or go direct
to much used directories etc..
It's probably a very good idea to use symbolic links to the atmenu dir.

I found the English docs but it insists that a Unix partition
is needed and a whole pile of Unix software.
I don't have Unix and I don't want it either. The docs also
suggest that installing Mint-Net is likely to mess up
everything else as well. This sounds like a M$ installation. ;-)

What's wrong with copying a folder to the partition and entering my
isp details in a file ?

It takes about 2 minutes to install Sting or Stik, why does MintNet
have to be so complicated ?

Marc-Anton has put a lot of effort into producing a detailed
installation guide but if this is the simple one, I am glad I
never tried to do the old Mint-Net installation.

Part of my job as a developer requires that I write
installation guides for "experts" and none of them are
every as complex as this Mint-Net installation. It's not
Marc-Antons fault but if a piece of software requires a
68k installation guide it is trying to tell you something.

I think I might try by skipping steps 1 to 50 and see if I
can get it working on a GEM machine.

Peter

Same here. If you right click or something you can get a little
configuration box, but that's as far as I got. Haven't a clue what it
does! Bengy said soemthing like the organisers of LBC actually offered a
free translation service for the programs and only one person actually
used it.

Need new subject line.

Found a source of wiper blades, but they will not sell directly to me.

There is no stock in part number 1301WBLADE, but there is lots of stock
in a corresponding Minolta number, SP6XWBLADE. The Minolta toner refill
fits too. Please excuse a bad part number, maybe, because my file on this
is at work, 225 miles (US) away. Anyway, The Epson Action Laser 1000 was
made with a TEC LB 1301 mechanism, and Minolta made parts for the Epson
printer, which is really a TEC LB 1301 printer.

The wipers seem to come in packs of ten, with individual ones selling
for about $2.50 USD. I have some on order, and will report on what
happens.

If you are in a bigger hurry, go to a DOS computer store and ask them to
get you some wiper blades for an Epson Action Laser 1000. And if you
need new toner in a hurry, go to an office supply store and ask the same
sort of question.

That is to be expected, since MiNT-Net is a port of NetBSD networking sockets. This obviously means installing a UNIX folder hierarchy and a few basic binaries, at the least.

> I don't have Unix and I don't want it either.

Nor do you need any.

Consider that "pile of UNIX software" at the same level as any "system applications" just like the Windows application register. In other words, assides from the fact that configuration files must be editted by hand instead of using Install Shield, those are system files like any other. Nothing to be affraid of.

As for the UNIX partition argument, a Minix filesystem is a zillion times better than a TOS filesystem, so good in fact that installing MiNT just for that would be a good enough reason, as it supports long filenames and offers better file access control than TOS partitions offer. Back when I started using MiNT, it became the first good reason to stick with it, even though any operation beyond setting up PPP meant learning UNIX basics; if you stick with setting up for your ISP, all you need to edit is the PPP script, modem Chat script and resolv.conf for the DNS servers of your ISP. That's it. See below for a package that offers just that, but nothing more.

> What's wrong with copying a folder to the partition and
> entering my isp details in a file ?

That won't give you a networking stack, will it? Configuration files without the bainaries designed to access them don't get anyone too far.

> It takes about 2 minutes to install Sting or Stik, why does
> MintNet have to be so complicated ?

So, why don't you go with those?

Alternately, look for a package called PPP-Kit 1.4 (e.g. Funet or Chapelie FTP sites should have it), which is a pared-down version of MiNT-Net designed to work on a plain TOS partition. Binaries

used are horribly outdated, though, and you will probably wanna use Jo Even Skarstein's GEM dialer instead of the clickable script kludge used in PPP-Kit.

As for STiNG, no, it is not easy to setup. I have found MiNT-Net to be _much_ easier than STiNG.

The problem is that with symbolic links you have to link all the files
needed by the application to run (like resources). So you end up with
"application.rsc", "application.dat" listed in the menu.
But one can also edit the .INF file to make it point to any
partition/directory on any drive. One can for example edit it to
atmenu_dir="u:/"; when one clicks on the Fuji logo it'll list all the
contents of the drives, a bit like the Jinnee desktop does.
The major drawback of this utility is that it's painfully slow. And the
screen redraws aren't that good either under MiNT/N.AES. But I'll look for
the next release.

> everything else as well. This sounds like a M$ installation. ;-)

Well i cant see how MiNT net could mess anything... It is physicaly on Unix partiton, and dont use and of cnf's of other stacks. And there is perfectly good reason for Unix partitons.. MiNT net aint limited only to be TCP/IP stack, but also offer server in multiuser envorment, for which access permissions and groups are needed so ppl wont mess your system..

Also whats so bad with Unix file system? It is faster and a lot more reliable as FAT based file systems, most apps run nice from them anyway so that shouldnt be a problem... Safe filesystem is a good thing to have in my opinion.

> What's wrong with copying a folder to the partition and entering my
> isp details in a file ?

Nothing, if thats single TCP/IP.. No need for filters, routers, safety mechanisms and so on...

> It takes about 2 minutes to install Sting or Stik, why does MintNet
> have to be so complicated ?

Because it offer a lot more. I have Riebl Ethernet card in my TT, MintNET take care for etherent to cable modem, plip connection to my main machine (Falcon), for IP masquarading, apache http server, ftp server, SSH server, telnet, nfs (so i can share files easily).. Both TT and riebl date from 1991, and a lot of ppl bought PC's etc as Atari supposedly didnt have good inet acces....

Another reason why it is complicated is that u want to install basicaly Unix network system on non Unix machine... Installing KGMD consist of dling 10-15mb of files, runing installer, answering few Q (like username and passord, root password and on what partition u want MiNT) and 30 mins of waiting.. Then u copy MinT net archive, depack it and type install, answer few q about hostname, ip, protocols and that is.

And a little parallel: give magic to newbie and at same time learn him about stik as well, and alice app, and that ramrom stuff etc.. and it will also look a bit confused..

> Marc-Anton has put a lot of effort into producing a detailed
> installation guide but if this is the simple one, I am glad I
> never tried to do the old Mint-Net installation.

I never found any of them hard.. Hardest stuff i ever installed was
WatchTower linux distribution... I had no clue what Unix is, all was to be
done manualy and kbd layout and docs were french.. I never regreted
though i was persistant.. unix is great..

> I think I might try by skipping steps 1 to 50 and see if I
> can get it working on a GEM machine.

Hm, i run MiNT and N.AES and i consider it a GEM machine.. There is not
much u cant run on MiNT... 99% of those are apps which require Magic... or
some very old GEM/TOS apps...

> PS There is no such word as "Lamers"

Agree 100%, but lotsa prejudices and predefined "iwe heard" opinions..

Yes, i would just add that in most cases, text config files are VERY
well documented... for example u can look naes_cnf.app and actual naes.cnf
file... o lot easier to edit it in text editor.. In app u have checkbox,
manualy u have 5 lines of commentar and then u enter false or true...

That area is usualy not clear enough.. MinixFS or Ext2FS are very
reliable, have good recovering mechanism (i didnt lost data since 95 on
them) and of course permissions flags exist.. And there is no problem
runing GEM apps from those partitons as well, so u can have minixfs or
ext2fs and run most of apps from them as well, exceptions are some older
or badly written apps.

> As for STiNG, no, it is not easy to setup. I have found MiNT-Net

True. Only one note, actual installing of StiNG is easier.. but thats
all.

A few months ago, after having read so many times that the ext2FS was so much better than the MinixFS I initialised an ext2 partition and moved on it all the GEM programs that were on my Minix partition. Almost /none/ accepted to be run from that filesystem. And I'm not talking about old or badly written programs. All the stuff in /bin was quite happy, but the GEM stuff in /usr/local wasn't. Talk about reliability. Even worse, while the MinixFS just doesn't run the 2 or 3 apps that it doesn't like, the ext2 crashed the system. I had to reboot and then be patient during the rather long process of checking the partition. I reverted to MinixFS with a sigh of relief. /That/ is a good filesystem for GEM. Are you really able to run standard GEM applications from an ext2FS?

6801. ST Games available in UK

Newsgroup: comp.sys.atari.st
Date: 2001-05-27 17:32:17 UTC
From: John Allen <john@johnallen.org.uk>
Message-ID: <th2ejufk3tmic1@xo.supernews.co.uk>
Source record: 45737

Going through my loft I found two boxes of Atari ST software, mostly games, from the 80's. Domark, Electronic Arts, Firebird, Grand Slam, Rainbird, etc. I don't know whether they work or not, but they are in original boxes. In the 80's I used to review software for home computers, and they are review copies.

Rather than throw them away I am happy to give them to an appreciative home (or homes - I could split, but I don't want to get into all sorts of haggling over who gets what) if you are prepared to collect them from the Fulham/West Kensington area of London or possibly from the Edgbaston area of Birmingham.

Drop me an e-mail if you can give them a good home.

John.

KGMD is rather easy to use. The only problem is that is all German and rather
outdated now. There is however an English addition made by Katherine
Ellis, KGEMD of something like that. This packet holds an English
description and some newer apps.
But as you don't want to use Unix stuff it will not very useful for you.

>
>Part of my job as a developer requires that I write

Complex they are but even I -a complete MiNT dummy who hardly understand
the way MiNT-net works- have managed to get online. You only must have the
will to succeed and (try to) read the docs. This is unfortunately
something people won't do anymore.

The so called userfriendly and easy-to-use MagiC seems to me harder to
use then N_AES. I've installed MagiCMac on my G3 some months ago. It's
still not working very good.

My Nemesized Falcon prints fine from NVDI, Imagecopy, Calamus -
what have you. Are you sure you have the correct printer driver
selected in the NVDI Print dialog? The only time I have had
problems like you describe is when printing from 1st Word Plus and
using the wrong driver (I have both NEC P2200 and DeskJet 520
printers and drivers for both - occasionally I forget to switch
drivers and get rubbish due to different control codes being used
by the two). But since you print OK with Turbo off, this is
unlikely to be the problem. Maybe there is something strange with
the timing in Turbo mode...

I certainly can us standard GEM applications from an ext2fs.

I haven't tried all the apps I've, but Gaston, Everest, Sysinfo,
Imagecopy,kobolt and Papyrus 8 does work. I'd a problem with Cab 2.80 but
after if converted the filenames to lowercases Cab worked just fine.
With Wordplus 3.15 I'd to convert the files to uppercases otherwise it
refused to start up.
Calamus SL2000 did crash the system. I wonder who's to blame here? Coltris
couldn't find some files and died with an illegal instruction.

Does anyone know of anyway to increase the resolutions of a Mega ST4 system? I've seen projects to fit an ET4000 ISA card into the ST but they seem way too involved for me. Fitting the ST into a PC tower was one thing but I think I could build a spaceship before I'd get the ET4000 project working correctly.

Are there any alternatives?

Hi,
I was reading some Mint-Net docs last night and came across
something that might help unless you have all ready tried it.
It refers to the renaming of devices done in the MINT.CNF

"Another problem for the beginner is renaming of the
serial devices. With this little distribution HSMODEM
from Harun Scheutzow will be installed, too.
That MiNT programms like pppd can handle serial devices
as well as GEM programs like Connect the serial devices

have to be renamed with the ren comand.
This looks like this:

ren u:\dev\modem1 u:\dev\ttya

With this comand you make the modem device accessible
for MiNT programs, but now there's no modem1 device
any more, so you have to give the following comand
to rename the HSMODEM device to modem1 device:

ren u:\dev\HSMODEM1 u:\dev\modem1

Because of this comand, the modem device can be accessed
by programs like Connect again."

Has anyone ever managed to get an upgrade to the Milan Blaster
software ?

The Woller website shows a newer version but there is only
a price for the full software package and no mention of
upgrades from earlier versions.

> of relief. /That/ is a good filesystem for GEM. Are you really able to run
> standard GEM applications from an ext2FS?

Yes, there is problem with GEM apps on ext2fs.. We discussed that with
author and it aint exactly ext2fs problem.. as i understand there should
be some fixes (cludges) added to ext2fs (minixfs has those) cause of some
GEM problems.. I run CAB, Aftp, Amail, Qed, Everest, Airc, some gem games,
Doodle etc.. i also keep N.AES and Thing on ext2fs (so u can set sticky
bit and run AES as root or user and use user dependand configs, if app is
smart enough to save inf in $HOME).. But i realy should say same as u do,
Minixfs is way to go for GEM.. I do have /usr and /home mounted on ext2fs
partitions and those runs very well...

Main point i wanted to say is, that unixfs partitons are better as FAT
ones.. Faster, more reliable and offer better access control.. PPL usualy
think that MiNT wants minixfs cause of long names.. thats not true.
Since MiNT is multiuser and open system, we need access control.. And
atleast on minixfs all properly written apps will have no probs...

Reliabilty is great.. I didnt lost any data on minicfs/ext2fs even when
i had psu failures and my GEM partition went off.. FSCK and little fidling
in lost&founf folder and i got all back... U think it took long to
check/fix partition? Try optimizing same size FAT partition.. not to
mention it can go wrong... i have minixfs from 95 and ext2fs some 3 years.

Ah this could be useful actually, as I don't think Taskbar had support for putting apps there. Hmm I think I'll adjust my marks for this.

>It's probably a very good idea to use symbolic links to the atmenu dir.

Yes, it would be a bit silly putting all your apps there :)

Hi,
Sorry to barge in like this, but I can't keep my mouth shut when I see such statements. This kind of rumours is the reson why people don't dare to change to a better platform for their music work. A couple of years ago, it was true - but not anymore. You can't use a cheap and crappy soundcard as your midi interface on the PC - but there are many cheap and very well functioning interfaces for the serial or USB-bus. To get the best performance with a PC, you need to put a little more money into the soundcard than you would on a game-machine, but the same extra cost (if not even more) was actually needed for a Falcon system to get good enough performance...

The ST and the Falcon were extremely good at the time they were released and several years on - but nowadays they're way behind since the platform isn't developed anymore. Face the fact that the world doesn't spin around Atari just because you want it to! There are actually people who still believe the world is flat, but that doesn't make it true...
I know that many studios still have Atari machines - but that's only because some of their customers still use the Atari - and since they can't get any money for the old machines on the second-hand market, it's better for them to keep the machines for the rare customers who still work with Ataris. For their main work, they use PC or Mac because they can make a much better job with those machines.
Most musicians I know, who still use their Ataris, are actually in the process of changing to the PC platform - the rest of them have already changed platform - because they want to use what they find best...

Today, when CPU speeds are enough to make a stable music system out of a PC, there's simply no meaning in using a reel-tape synced to an old computer running and old version of Cubase - when you can run everything in one computer. The Falcon is an option - but if you want professional

performance, you need hardware that isn't manufactured anymore. If you need more than 8 audio tracks, you can't use the Falcon either - and if you want to have the whole studio in the computer, just forget it! These are things that can be handled in a modern PC, where you can use software synths, you can use several effects units and mastering tools - all at the same time within the computer, as plugins.
The new midi interfaces use what's called LTB - Linear Time Base - which gives you a terribly much better midi sync than any Atari machine could dream about. Sync between midi and audio is also much more accurate than on an Atari, as well as sync between audio tracks, which is sample-accurate.
Don't speak of Atari as the saviour of all problems when it isn't true!
If you still use an Atari and think it's good enough - that's good for you, but don't try to convince people of getting worse equipment than what they actually want.
The only thing I regret after making the jump to hyperspace from a turtle-speed Falcon (with every musical extra equipment you can think of) to a lightning fast PC, is that I didn't make the jump earlier...

I still have some Atari support on my website and always will, as well as I'll always help people who have Atari related questions to the best of my knowledge. I still have a Falcon, which I won't part with for nostalgic reasons, but I never use it since the PC is much better for everything.
I was a die hard Atarian ever since the 520ST came to the market (I also made the main part of all warranty repairs of Atari machines in Sweden until the demise of Atari) until about two years ago when I changed platform - when I finally dared to face the facts of life...

In lotsa cases its to blame simple error.. Coders should use lowercase
for hardcoded paths etc... Those paths are automatcaly converted to
uppercase when accessing TOSFS... Incase coder use uppercase and u copy
files to unix parrtition and default conversion is lowercase, files aint
found.. Simple converting to uppercase helps...

That's totally wrong. MiNT-Net isn't a port of anything. It's written from scratch and for sure BSD compatible.

Hello!

> What's wrong with copying a folder to the partition and entering my
> isp details in a file ?

You answer your question self. You only see MiNT-Net from your small point of view. You have an fixed dial-up connection with some special config parameters.

But MiNT-Net is much more complex as it have much more functionality as for an simple dial-up connection. MiNT-Net support much more interfaces (ethernet, slip, ppp) and all of this need it's special configuration. Also the application interface is much more powerful and for that it require more configuration too.

Infact, for a simple client configuration you can break down the installation to copy some files and add some symlinks in u:\ and configure the ppp. If you use then wvdial you only need to tell the phone number, login and password and wvdial do all other things to establish a connection self.

>[...]
>Are there any alternatives?

Well, yes.

There were once upon a time several graphic cards which could be
plugged into Mega's expansion port. Maybe you can find one.

However, from your post it appears that you are thinking of some
do-it-yourself approach. There are some possibilites here, too:

* The simplest hack would the "Overscan" which existed in several flavours,
ranging from a simple switch to a more sophisticated commercial product.
There is a simple (two chips) shareware version called "Lacescan". You can
achieve resoluton of 704 x 480 in ST-high with a well-adjusted SM-124
monitor, but in practice the figures can be slightly lower.

* A potentially most beneficial approach would be the one which involves
raising the clock frequency of the entire system to 10MHz or 12MHz.
Besides getting a noticeable acceleration of everything, this is supposed
to enable you to obtain resolutions of something like 800x500 (mono) or even
more on a SM-124 monitor- if you can get the sync rates right. There was an
article in a german computer magazine once (ST-computer, september+october
1992 ?), describing this modification, but it seems that today noone can
quote -exactly- the modification needed for video circuits. I have a general
idea of how it might work, but a tested schematics would be so much easier-
so if you find one let me know :)

>I have a few (important) Atari ST formated disk.
>Know of any program that will allow me to read them from a PC?

There are some DOS utilities which will read the contents of an ST formatted disk, even when MS-DOS won't read the directory.

It may be difficult to locate these programs now, but try searching for ST2PC.EXE and STTOPC.EXE

You run the program, then insert the ST formatted disk and the program displays the contents of the disk and lets you copy the files onto the PC.

It doesn't change the ST disk at all, which is FAR safer than using a sector editor to muck around in the boot sector (which is what it takes to make the disk directly readable on the PC).

If you can no longer make a native copy of the disk on an ST, then I would immediately write-protect the disk and forget about trying to change anything on the disk, or else you run the risk of losing EVERYTHING on that disk.

Try using one of the FTP search engines for STTOPC.EXE if you can't find it on any of the "normal" file archives.

At this point anything that can raise the resolution/colors I'll take. With something of this caliber I'd rather get something that will plugin and go without too much work. I have looked at some of the overscan circuits on Vezz's website and it seems that would be a good place to start. I'd also like to put a 16MHz accelerator in but an 8MHz ST isn't that bad for most stuff I use it for (games, light graphics)...I'd like to be able to use stuff like Thing desktop but you need at least 16-colors to see the "beauty" and 320x200 is very compromising when you are running a GUI :) Thanks for the ideas...I'll look into them further.

If you mean the Nordic Atari Show in Malmo then http://www.sak.nu is the best place to go for information, they also have a map and directions for getting to the venue, though from the UK you might be better off looking at going to Copenhagen and then to Malmo as opposed to going via Stockholm as Copenhagen looks closer and I believe that a new bridge virtually links the two.

I have two progs, one to turn turbo on, the other to turn it off. As
soon as I set it to "off" it prints fine. I do have the right driver,
tried this as I thought it may have corrupted. It seems strange that
other progs like Imagecopy work fine in turbo mode. I don't know what to
blame, NVDI or the accelerator. I'd be more worried about the accelerator
though, I wouldn't call it a work of art.

Overscan/lacescan or buy a PAnther from http://www.wrsdesign.de which is
the adaptor for ET4000 ISA graphics cards. Panther should be an easy fit
onto the megabus.

Or look out for an old Matrix card for the Mega ST. Best solution would
be the panther I feel.

I looked at the Panther and that would be great as it would allow me VGA video AND ethernet capabilities if I wanted them. Do you know if anyone at WRS Designs speaks English? I no absolutely no german.

Another dumb question. The price of the adapter and an ET4000 graphics card is 249,00DM... If that 24900 German Marks or 249 German Marks? With 249DM equal to about $110 US I assume 249DM

Roland speaks English quite well, enough to be able to buy/sell. I've
bought many stuff from them and they're reliable, never had problems with
them.

Yeah, some countires use a comma instead of a full stop. It is 249DM, or
about 83 UKP. I never looked at the price, but I can tell you that's a
good price. They also sell PCBS only IIRC and recently they've added all
the GAL expressions ont he site so you can make your own Panther/PAK etc.

>
>What OS are you using, this might have a bearing on the possible answer.

Hi Steve,

Thanks for replying, you're the only one so far!

The answers to your two questions are in the original posting,
although I can enlarge on the second one a bit.

The OS used is TOS 1.62, and what I'm trying to do is to call an
accessory's own menu from the keyboard so that mouse doesn't have to
be used to select one of six, as this way it is easy to get the wrong
one occasionally. Using a keyboard call the right one can be selected
each time without using the eyes, or taxing the brain as much!

The program has to small, as it will be used by other people in the
group I run on floppy-based systems (ie no hard disk).

I hope you have an alternative suggestion to using the Deskey program
which seems to have a few snags but which is a credit to its compiler
because it still works in spite of how long ago it was written.

Regards,

George Moulder

Yes, it is simple and cheap... I made it in 20 minutes & 2 $ cost.
But.... not much software can use it, and you need at least TOS 2.06 for
correct work.

Hmmm... I think that such projects are very hard for realize, even if you find all ST magazines involved.

Btw. best Atari ST projects were in German CT magazine, you can still order them on CD's from them: http://www.heise.de/ct .

There's some I know who are quickly changing back to the Atari or
keeping both to use as they wish.

> Today, when CPU speeds are enough to make a stable music system out of a
PC,
> there's simply no meaning in using a reel-tape synced to an old computer

No No No, b******s. If the reel to reel gives you what you want you will
use it.

> that can be handled in a modern PC, where you can use software synths, you
> can use several effects units and mastering tools - all at the same time
> within the computer, as plugins.

Yup, just consult alt.steinberg.cubase, everything works happily
together.....

> The new midi interfaces use what's called LTB - Linear Time Base - which
> gives you a terribly much better midi sync than any Atari machine could
> dream about.

Can any body tell, in the Atari midi - synced to tape system?
Does anybody care? If it stops and starts in time get on with making the
music.

> Don't speak of Atari as the saviour of all problems when it isn't true!
> If you still use an Atari and think it's good enough - that's good for
you,

Exactly!

> but don't try to convince people of getting worse equipment than what they
> actually want.

The continuing problems do that without any help from the Atari users.

It's horses for courses, but don't ever try to tell me the
Atari can't do most all of the MIDI tricks other platforms can.

Applications on an ext2 partition _must_ have the executable bit
on, while Minix 0.60.1 has a kludge that makes it behave like a
TOS filesystem. Most applications run from ext2, on my TT.

Source record: 45685

About GEMDOS, the abstraction layer that handles the filesystem
operations for applications (MiNT is a GEMDOS replacement):

* GEMDOS has built-in filename truncation and case conversion.
This means that when copying or moving a file from extended
filesystems to DOS filesystems, TOS alters filenames to fit
the limitations of the destination filesystem.

* Extended filesystems consider a file to be executable _only_
if the executable bit is set to "on".

* On unspecified or default filesystems (such as TOS), where no
mechanism exists to determine what constitutes an executable,
the file is passed as such to the next abstraction layer. For
TOS, this usually means the AES (a.k.a. GEM) which interprets
a file's purpose based upon a precise list of extensions that
qualify a file as executable (e.g. PRG, APP, ACC, etc.).

Because of the above, one could assume that any filename will do,
but several applications cannot e.g. find their resource files,
when started from an extended filesystem. Why is that?

The default conversion rule is simple:

* DOS/TOS filesystems are uppercase, with 8+3 filenames.

* Extended filesystems are lowercase, filesystem-specific lenght.

If an application is programmed to specifically request an UPPER
case filename for its resource file, it will not find it on ext2.
However, applications programmed to use lowercase filenames work
equally well on ordinary TOS filesystems, because GEMDOS converts
all file operations to UPPERCASE 8+3 filenames.

6851. MIDI Thru desk acc?

Newsgroup: comp.sys.atari.st
Date: 2001-05-28 15:00:13 UTC
From: sonik@wearelondon.fsnet.co.uk
Message-ID: <9etp5t$1hs$2@newsg3.svr.pol.co.uk>
Source record: 45686

Hi folks

I was thinking the other day why I've never come across a desk acc
that patches your MIDI In to your MIDI Out socket and thus saves
you having to boot up your sequencer or librarian or whatever.

It certainly would save one having to do this when doing important
but no song-based stuff like programming.

Any ideas?

Cheers :)
Al

I'm not afraid of any software, I write and maintain multi-million
pound systems for a living. I just have no intention of installing
a partition that I have no wish to use. I don't want to re-ignite
the whole Mint v TOS argument but I only use TOS software. If
I want unix I will buy a unix box. I only want SSL so it seems
a bit unneccessary to re-build half of my Milan to get it.

My ISP, Skyenet, allows me to sign on with just about anything that can handle PPP, TCP/IP, and has it's own browser. I periodically sign on with my Dreamcast to it!! As soon as I get a hard drive for my STE I'll be signing on with it also(once I figure out everything I need, hint, hint, to all knowledgable individuals). Right now though I mainly use my AMD based PC, and will be signing my 5 year old daughter on line shortly with her Power Mac to the same account. Univeral ISP's are out there and not really expensive either (mine is $19.95 a month) but mine is also regional (IL,MI,OH,IN) if this is within your area here is the web address www.skyenet.net

good luck
Brent

That would be really cool if it was true.
I have to use the atari for the midi as this tbird athlon with delta card (1010), 256meg ram won't stabilize. Yes I read all the docs about stabilizing midi, and read all the other people problems in FAQ (I am not the only one), maybe you have a secret that never fails, if so, please share it to the world. Or maybe you don't realize how much your PC slides with midi, after all some people think that mp3 at 96kbps sound great!.

I /had/ the executable bit on, of course. I'm not stupid. Nevertheless,
almost every GEM application crashed the system. So I guess I made a
mistake while initialising the partition. I'll retry on a Zip cartridge.

There was one, and I think it was on some coverdisk I had. I reckon looking in the midi section on funet might get what you want. I have no idea what it was called, sorry.

> the world is flat, but that doesn't make it true...

Really what do u wana prove, that i as Atari fan am some primitive
idiot? Look my text above, i said "SOME PURE Midi" musicans chage back or
stay.. I know because iwe sold 2 MST's to two guys, one was very ashamed
by some Windows crash during concert (maybe it was setup etc i dont
know) reason for other guy i dont know... My only mistake was i used word
"best" instead "very good" and that provoke u in this reply.. Shall i
from now on talk in my native language so that will not happen?

To make it clear, im aware what Atari can do, what PC/Mac can do.. i
know Earth is not flat u know, and to all my pals i proposed PC, esp
lately, im no idiot u wana make me, im just Atari FAN, i dont throw
machine just so.. i can live with it with some disadvantages.. PPL without

that feeling as u, will never understand that, and call us names.. Ever though why WV beetle fans drive them? At high cost? they could go for newer, safer, "better" machine and then brag and spit on other Beetle fans..

My fact still stand: ST is after 15+ years STILL in serious usage, mostly on MIDI market... I did NOT say its most used, it did NOT say ST is better as PC, and for sure it is more stable.

> Today, when CPU speeds are enough to make a stable music system out of a PC,

To do such a thing one would have to intercept vectors and draw on a
screen area reserved for another application. Strictly speaking neither is
illegal, but it's nasty...

Ahh, yes, thanks Derryck.

>I also had a result with GEMSpooler, but the iPRN solution's better IMO.

When I last tried the demo of iPRN I saw no speed advantage. I guess you
can only go as fast as the printer will allow, especially since mine is 6
years old now, Epson 200. iPRN is in my tools directory as given when NVDI
installed.

I think I'll try the routing though as you suggested above. The problem
comes is when I use a screen mode that needs to be in turbo mode and so
this is why I really need to find a solution. And well, you know what
happens when you switch turbo mode off in an exteneded resolution.

He can try it the SLOW_PRN.DEV from the NVDI 5 installation disc.

Yeah, the only patch I saw was for removing the IDE boot delay or
something very similar. Hmm, maybe I should check this out after I try
routing to BIOS or direct etc.

Thanks Jo, this may be the problem.

Why am i not suprised!. :-)

>The answers to your two questions are in the original posting,

I must have missed this, however..

>although I can enlarge on the second one a bit.

I personaly would attempt to install another copy, renamed .PRG instead of .ACC, install in on a key-combo of choice, in theory running this second version would make TOS realise its already running and invoke the version in memory.

In general if a ACC wants to be callable from the keyboard it will allow it, if it doesnt... :-)

Let me know if this works please.. Good luck.

chances are that it is the programs own format, but try XNview and
Infranview both easy to find freeware PC file viewers, both can read and
convert around 200 pic formats. Or like u say u have to use the original prg
under emulation to convert, there are plenty of free emulators and are
easily setup in a few mins

Well, I have the magazines here and it was the ST-Magazin. I guess it worked the same way as Overscan because Hyperscreen (as it was called in the magazine) was made by the same people who created Overscan.

Greetings,
Matthias

> with midi, after all some people think that mp3 at 96kbps sound great!.

This comment speaks for itself, since everyone who's been around long enough
knows that AMD isn't as stable as Intel. I'd never take such a chance just
for saving a few bucks when building a music studio... I haven't tried the
Delta card you're talking about, but I know that my RME Hammerfall works
flawlessly ;) If the Delta has Midi built in, I'd try a separate Midi
interface instead, since many cards with midi integrated actually do have
bad timing... If you're using a motherboard with VIA or SIS chipset, some
soundcards don't work properly... Intel is the safest bet here too.
PC sliding with midi? Not one bit. It's rock solid and better than any Atari
since the midi interface (Steinberg's Midex8) receives the data with a sort
of time-stamp before it's supposed to play, enabling the interface to send
the data on to the synths at exactly the correct time (as exactly as the
midi system can be...). My midi system was actually good enough with the
interface I used previously (Opcode Studio64XTC), which doesn't have the
"time-stamp" function - but that's probably because I don't use the midi
system to extremes - because of the fact that I have many separate outputs.
Since I've been a musician for over 25 years and working with computers for

the last 15 or so, making my own home studio recordings, as well as live mixing and pro studio recordings, I can say with confidence that I know what I'm talking about when it comes to sound and timing...
I've built several PC's for musicians with success every single time. My own machine is loaded with games and everything else and it still chews away with VST/32 perfectly without any Windows-optimization whatsoever, which has become so popular when people try to make too crappy machines run VST... I can still get 52 simultaneous audio tracks, with VST's compressor on all of them and a bunch of plugin effects, as well as some send-effects. Midi runs along with as many tracks as I can ever have use for. Works like a dream :))

I thought that my Falcon system also worked perfectly - but that was before I changed platform. This means that the Falcon was actually good enough from the start (just like it still is for many users), but I got a nice surprise when I changed and got a better system than I had hoped for when I decided that I wanted the extra functionality and speed in VST as opposed to CAF. I used CAF for several years and before that, it was the "normal" Cubase ever since the first version - and before that, it was Pro24...
I still think that Atari made great machines and many are still functioning, but since there's no development, you don't have the possibility to enhance your studio if you're using an Atari. Maybe you don't need more functions? That's ok too, since you can make great music with a very simple system - but many of the options when using VST instead are really useful, so it's hard not to be tempted... ;)

Best regards,
Claes

I've had no problem NVDI 4.1 and my printers at home it drives a EPSON STYLUS 600, ATARI LASER 804 and a PANASONIC KX-P 1124. At work it drives a Hewlett Packard Ink Jet Fax and Printer and a IBM 24 pin, the EPSON and the H-Packard are about 2 years old. I just installed NVDI-5 and it seems to be printing ok, but I don't have any experience with it yet......

Later, Donner.....

For plain TOS there is no SSL solution. If you want SSL and TOS
compatibility you must install MiNT/MiNTNet. As the socket/SSL part is a
Unix port it still require a Unix like setup. If you want a SSL solution
for plain TOS write one.

What do you want to tell me? I'm for sure know much more about MiNT-Net
than you and it's infact written from scratch. I know for sure the NetBSD
socket and TCP/IP layer too and can always compare.

Maybe you mention next time some references and facts before you stuffing
carrots here.

>to Sweden from England, also I would like to know the nearest accomodation
>and transport.

Yes, it's definitly on! Malmï¿½ is located in the far south close to Copenhagen, Denmark. Because of the new Copenhagen-Malmï¿½ bridge it's easy (but not free) to get there both by car and train. Note that this bridge has been opened less than a year so it's probably missing on most maps.

There are some possibilites to stay over night for free. Check the NAS webpage for contact info.

Nick Harlow from 16/32 systems will be there selling lots of stuff. Note that he will not be able to answer e-mails right now as he is on vacation.

I posted this announcement here some time ago:

Nordic Atari Show in Malmoe, Sweden 16-17/6

The seventh annual Nordic Atari Show (NAS) will take place in beautiful Malmï¿½ this year. Malmï¿½ is located in the far south of Sweden. Atari enthusiasts from all over the country and abroad will gather together and participate in or just visit the exhibion.

The show is opened 16-17/6 and we welcome anyone to join the show. Entrance fee is SKR 50/day (appr. 5 EUR).

16/32 Systems from England will be there selling all kinds of Atari products. If you want to buy anything special please contact him on nick@1632systems.co.uk in advance or visit http://www.1632systems.co.uk/ He really needs to know what stuff to bring...

There will also be second hand Atari computers, monitors etc on sell. Please contact bebbe.adolfsson@swipnet.se in advance for availability of any specific item you would like to get.

If you want to sell anything yourself just bring the stuff with you. There will be plenty of tables available at no extra fee!

We plan to do a lot af networking this year so bring your Ethernet adapters, nullmodem cables, MIDI cables, etc to join the network.

As Malmï¿½ is located close to the main European continet we hope to get visitors from Denmark, Germany, Poland, etc too. And, thanks to the new

bridge from Copenagen it's very easy to get there!

For more info browse to http://www.sak.nu/ and click on the "Nordic Atari Show" button. Info in English can be found further down on the page, maps included.

BTW, I've observed that my Microtek scanner driver ScanX crashes if I ask it
to rescan the SCSI bus, needed if I switch the scanner on after booting. If I
switch it on and then run Steffen Engle's SCSIDRV.PRG, it's fine.

Also I've found that I must first run that driver if I want to use GEMAR,
regardless of whether the DAT drive had been "seen" by HDDriver at bootup.
Since GEMAR doesn't like the Centek TOS in my CT2'd Falcon anyway, I'm
guessing that this might have something to do with it in this case.

That's as maybe, but I think you'll find it will help you.

There's also a version of that driver which lives in MagiC's "Extensions"
folder, but it is only available to registered owners.

6891. Atari Books FS

Newsgroup: comp.sys.atari.st
Date: 2001-05-29 11:52:07 UTC
From: Fred Horvat <fmh@netzero.net>
Message-ID: <3B138D67.DE6C7408@netzero.net>
Source record: 45622

Hi,

Here's some Atari ST books that I'm not using
anymore. Those are my asking prices. Buyer pays shipping.
E-mail me at fmhcom@operamail.com for more info.

BOOKS $10.00 each unless noted

6502 Applications. Published by Sybex.
A comprehensive 6502 Assembler book.

6502 Assembly Language Programming. Published by Osborne/McGraw-Hill.
A comprehensive 6502 Assembler book.

680X0 Programming by Example. Published by Howard Sams & Company.
An Assembly Language book for the 68000, 68010, 68020, and 68030
line of chips. Has a ton of code and illustrations.

The Atari Assembler. Published by Reston Publishing Company.
A very illustrated book covering Assembly on the Atari 8-bit.

Atari Roots. Published by Reston Publishing Company.
A guide to Assembly Language for the Atari 8-bit computer.

Atari ST Application Programming. Published by Bantam Computer Books
A nice C programming book with lots of examples.

The Atari ST Book. By Ralph C. Turner.
Tips, Instructions, Secrets and hints for the Atari ST line
of computers.

Atari ST GEM Programmer's Reference. Published by Abacus Software.
A complete guide to GEM programming with C.

Atari ST Internals. Published by Abacus Software.
Book covers every processor, chip, component, and register
in the ST all in Machine Language.

Atari ST Programmer's Guide. Published by Weber Systems.
Focused towards the beginning ST User/programmer.
Covers BASIC and LOGO

The Best Atari Software. By the Editors of Consumer Guide
This book covers all software for the Atari 8-bit from
productivity to games. Hardware requirements are listed and
each piece of software is rated on a scale of 1 to 10.

Compute's Atari ST Machine Language Programming Guide. By Compute Books.
A very good book on Assembly for the ST.

Compute's ST Applications Guide programming in C.
A clear and comprehensive guide to writing Atari ST applications in C.

Compute's ST Programmer's Guide.
Covers BASIC and LOGO.

Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples.

Intermediate and Advanced Atari ST Subjects. by Ralph C. Turner.
Covers topics like hard drive management and optimization, Running IBM programs on the ST, Connecting SCSI devices and more.

Machine Language for Beginners. By Compute Books.
A beginners guide for Atari, VIC, Apple, C64, and PET computers.

Programmer's Guide to GEM. Published by Sybex.
GEM Programmers guide in C.

Hi all,

New MagiC offer:

To let users take advantage from the good results of the association,
MagiC is now provided with the following programmes:

- Aniplayer (registered version)
- AtarICQ (registered version)
- Jinnee
- MagiC Scripter

MagiC price remains unchanged: 99.00 Euros

Have a look at the ES MagiC webpage (French):
http://www.europe-shareware.org/atari/logiciels/magic.html

Best regards,
P. Ricard (ES)

I have set-up the PPP-Kit. The instructions are reasonably clear
about how this version is designed to work under TOS & Mint.
It still includes a whole load of Unix apps. If I get it working
I will gradually dump them until I have just what is needed by
Mint-Net.

I got the GEM dialer by Jo Even but it doesn't do any setting up
so it is still down to hacking the scripts. There isn't much
guidance here in the PPP Kit. At the moment it doesn't even
manage to find my Modem. Also, my isp uses a pure PPP login,
with STiNG I don't have a script that waits for "login" and
sends a reply so I have no idea what to put in the MintNet
script files.

Regards,
Peter

Hi, I currently have 2mb STram & 4mb TTram - i want an upgrade :) Can anyone please advise the best place to go (UK), and any other upgrade advice would be appreciated. Thanks, steve.

6904. how do i upgrade mt 520stfm

Newsgroup: comp.sys.atari.st
Date: 2001-05-29 19:48:49 UTC
From: K_Turner <kdt1@ukc.ac.uk>
Message-ID: <9f0uke$p95$1@athena.ukc.ac.uk>
Source record: 45635

I have an atri 520stfm

It has 0.5 mb ram and an internal disk drive which might be single sided i dont know for sure.

I also got a load of software for it but most of the games either require 1mb or a double sided drive

how much will it cost and where can i upgrade it

i dont want to spend a lot on it i just want to restore it for nostalga and the fact that its an atari!

thanks
also i wonder if it is possible as i have asked before to convert .st and .msa files that i can download for st emulators so that when i put them on disk i can play them in my atari. i have make disk v1.5 but it seemsd to do nothing can anyone tell me the exact command i have to give it or an example

thankyou for any help

Karl
(proud Atari owner)

6905. Hybrid Arts Edit II Track

Anyone using this pgm for sequencing have this problem:
On my STe (4 meg) using a megafile 30, a very simple keyboard track(under 50 notes) using over 6% of memory for no apparent reason? Somewhere in the track something is using all this memory, but neither the Graphic or the Event editor 'sees' anything. This anomaly rarely happens when I sequence, but when it does the sequencer slows down to a crawl(editing, playback, etc). Any ideas as to what causes this? Fixes?

> How did you acheive the internal modem?.

I didn't, Bernie Diotte did it ages before I bought it from him.

Basically, the modem's PCB happens to match the width of the VME slot's guides and the depth of the VME compartment, and wires are soldered to the 12v and 5v busses. At the back of the TT, there is a short cable from the modem's serial connector to Modem2.

If you have professional soldering skills, there are instructions
at the URL below to modify both the ST and TT RAM card by Atari.

As for alternate products, several options exist, but none are
manufactured anymore. Description at same URL.

Best beat would be to find an STE, you will have a lot more fun with the demos and the few specific games written for it. You will also find the memory upgrades are much easier.

I have seen STEs for as little as £20.

Hello Diedrich,

Thanks for the info. Might be time to get one of those HP's for myself before it's too late. Can you use the max dpi possible (600x600 ?) on your HP 930C printer with that NVDI driver for the HP deskjet 890 colour ?

Cheers
Dan

I use an Epson Photo 700 with NVDI 5.03. It works well since NVDI has the driver for that printer built in. My wife has HP LaserJet 2100 attached to her PC. I tried it out on my Hades and found a HP laser printer driver that worked. I ws able to print some docs and a spreadsheet. I wish NVDI would get an upgrade.

>Folks,
>
>As there don't appear to be any currently available interfaces for STs
could
>the techniques used at http://www.eix.co.uk/Ethernet/ be adapted to
>interface to the DMA or Cartridge port?.

DMA is possible I think, maybe even performance wise. Cartridge port is read only... no dma either. At least on the 520 that I have, no idea if this is different with later models. According to Atari ST Internals (by K. Gerits, L. Englisch, R. Bruckman) the DMA port can connect up to 8 devices. Not to mention that with dma itself, the ethernet device could be simplified significantly. Maybe as few components as the ethernet controller (would want to consider the realtek chip, for get its #, and the Crystal cs8900a) and a smaller pld. (well, and an 8k serial eeprom, transformer, various connectors)

Would be fun though, wouldn't it?

Thanks,
John

>> * The simplest hack would the "Overscan" which existed in several
>flavours,

> Yes, it is simple and cheap... I made it in 20 minutes & 2 $ cost.

Indeed. Though it seems Lacescan has a slight design flaw somewhere
in hardware or software: when it is switched off sometimes the screen
does not revert correctly to normal size, but a portion from the right
edge rolls to the left edge- so something was neglected. Otherwise
the roll-over would happen always or never.

>But.... not much software can use it,

I disagree very much! I have installed Lacescan in my Mega and have it
turned ON all the time. There are just a few older programs which can't
use it, but anything decently GEMish works OK. I remember, however
that some setting in NVDI-configuration CPX could make problems when
Lacescn was turned on- the menu bar was improperly drawn in some
programs.

>and you need at least TOS 2.06 for correct work.

Possibly. I use TOS 2.06 (in RAM for the moment) so I did not try it
much with older TOSes.

>> * A potentially most beneficial approach would be the one which involves
>> raising the clock frequency of the entire system to 10MHz or 12MHz.

>> easier- so if you find one let me know :)
>>
>
> Hmmm... I think that such projects are very hard for realize, even if you
>find all ST magazines involved.

Not necessarily. I played a little with that project and for a start raised
the system clock to 10MHz (40MHz oscillator). By declaring external
syncs to TOS and by supplying the correct (or I thought so) sync pulses
obtained by dividing the 500kHz signal, I obtained a standard-resolution
picture on a SM-124. From that to an extended resolution it should not
be very difficult to go. (My attempt was not completely successful as the
picture trebmbled slightly (about 10 pixels) left-right, so I did not get
everything exactly right- or else at higher CPU speed the picture

started too early after a hsync pulse nd the monitor maybe couldn't handle it). It was all done with several 74F and 74HCT chips.

I didn't have time to finish it, but I prepared some connections on the motherboard to make everything more reliable, and will try again with a modified circuit. My problem is finding reliable information on pixel clock rates and line width- somehow the numbers I have do not add-up correctly to 35.7Khz .

However, I experienced problems in ordinary TOS a couple of times,
when an application did not list existing files of some specific type
in the file selector, because the mask was specified in lowercase.
I think this happened to me with Newsie, so I went with a hex editor
into the code and changed all mask strings to uppercase.

Ah, OK.

He can use any PCI graphics card with an S3 Trio64 chip on it (Trio64V and
Trio64V+ are working, too), preferrably with at least 2MB of video ram.

Well, something happened on the News forum of Atari.org. A thread developed regarding software, and suddenly it occurred to us that all the posters where actually from Canada. Spread out over thousands of miles and many days drive from one another, it was clear that we weren't going to hold weekly meetings;-)

That said, one of the posters took it upon himself to create a web page with BBS forum dedicated to Canadian Atari Users. Of course everyone is welcome, the intention is to locate as many Canadian Atari Users as possible. Hey we are here and we are not alone.

This convergence of users might just allow hardware and software developers as well as distributors a better view of how to service the Canadian Market.

I hope you are reading this Ken and Dan.

So check out

Mac. I prefer the Amiga, but Mac really is the best if you're computer-
illiterate. If you actually know something about computers, AmigaOS is the way
to go.

>For this discussion's technically-minded crowd's sake, be precise
>and mention all the specs, then move on to describing how nice
>and easy-to-use your OS is to accomodate ordinary users.

It should be very small, efficient, with both GUI and CLI /in unison/, with
a lot of modularity and code sharing. Not to mention being transparent to the
user. No stupid commands like "slrn" or arguments like "-lrFn" or "/d /a /w",
no system files named "BFTH32_1.DLL" or "libdso4.01.a.02".
Transparency, make everything as obvious as possible.

What autofolder programs are you running? Unless you are using the
diablo cpx, you could probably do away with xcontrol as well. Depends
on what version of the diablo 630 you are running. I still use the
buggy earlier versions that are very sensitive to accs and autofolder
order.

Hopefully you have the 630 autofolder prg on;-).
Also do you need edith?
Get the diablo working then add the other programs.

Do your 630 fonts load? Does your 630acc work? Will it test print?

Good for a start, later Brian.

madmax wrote:

> Good for a start, later Brian.

I wish I could tell you! <G>

I'm not that stupid, I just have access to the TT on the weekends.
That's because it's 130 miles away. <G>

I'll post a complete reply this weekend.

In a nutshell, the Diablo emulator and fonts load, then the message that
the SLM804 is not detected. AFAIK, I'm running the latest version of
the ACC that was uploaded to Genie years ago. I could be wrong here,
tho'. I've thought about digging out my copy of Laserbrain and trying
it also.

Another thought that occurred to me after leaving the weekend "home", is
to test things by bypassing the external HD I have attached to the TT.
That may be the source of the problem also. I'll really be bummed if
that's the problem. Cabling to this unit is also a possibility.

I'm relatively sure I never had the 804 attached to the TT. IIRC, I had
it attached to my Mega 4.

I want a "notepad" of some sort to write notes and such about the
drawings as an acc since I'm running plain TOS. I chose Edith because I
like it. I have Steno and a couple others from the days when Atari was
still making computers.

Two things:

What is the best ST emulator for the PC, and where can I download it?

Where can I download emulators that run on an ST to emulate retro machines?
A PC emulator would also be fun!

Paul

Hi Forrest

Good to see you here!
Go to MIDI on the Menu and look at INPUT FILTERS. Make sure AFTERTOUCH and any other controller info you DON'T want are in fact Filtered. This might be your problem.I know Aftertouch uses up a lot of memory in a hurry!

First: The PC is a much better machine to emulate other machines. As the ST
is retro itself and quite slow there are not many good emulators. The only
ones which run with a satisfactory speed are the ZX81 emulator, ZX_Sp
(Spectrum) and QLem. Check out http://www.atariuptodate.de for links.

Thomas Redelberger has :) It should work easily but just remeber that
modern ISA NE2000s have no jumpers and so you'll need to set it in a PC to
set the base address as it may have got changed from the 0x300.

Using Atari brand boards, assuming you can find them, 10meg STram
and 16meg TTram.

There are sone 3rd party TTram upgrades that can handle 64meg or
even 256meg.

> By the sounds of talk in this thread, I'm guessing that I may need to

You better have a look, maybe you will get lucky and have one
of those TTram boards with 4 simm slots, which you can simply
upgrade to 16meg.

Why Mac? Why Amiga? Remember the need to justifiy yourself
extensively. Recursive sweeping spiral statements won't do.

Right, so what do DLL's have to do with Mac or Amiga? If you're
gonna say Mac and Amiga, justify those, don't run around in
circles on what other platforms do.

Nobody has ever confirmed this. However, I would tend to trust
those who privided the instructions.

I would definitely like to heard about anyone that has succeeded,
so I can add comments similar to the ST-RAM upgrade.

That may work, it may not. He has gotten it working with several cards, to greater and lesser degrees. We oughtta start piecing together a compatibility list for him.

I've got most of the layout done, if someone wants proper gerbers. Also working on cad blueprints for a proper enclosure. Jameco sells a perfect power supply for this thing, and tiny too. Can't find any pcb mount db19 connectors though.

Thanks,
John

PS I'm new to the Atari community... do I understand correctly, that this will work with my 520ST?

6964. Classical Cd's Created on Dr T's KCS available

Newsgroup: comp.sys.atari.st

Message-ID: <ce22d101.0105300733.624a4ce1@posting.google.com>
Source record: 45594

I have been in contact with a certain Jeffery R. Baker and he has
informed me that all these CD's were created using Dr T' KCS!!!

here is his response to my inquiry:

---

http://www.jrb-cd.com/HTMLs/JRBCD9002.html
http://www.jrb-cd.com/HTMLs/JRBCD9003.html
http://www.jrb-cd.com/HTMLs/JRBCD9004.html

Tim Said:
Sorry for the Question, but were these done on KCS? If they were I can
post about it and perhaps get some sales for you from our group!

JRB responded:

I did those c3 ds using the KCS/Atari and the following.

http://www.jrb-cd.com/HTMLs/JRBCD2001.html
http://www.jrb-cd.com/HTMLs/JRBCD3001.html (I produced and did some
extra arranging.)
http://www.jrb-cd.com/HTMLs/JRBCD9001.html
http://www.towerrecords.com:80/product.asp?pfid=1116392&from1=

- jrb

These selections sound real good...if you like this type of
music..please GET EM!!!I will!!Rather excited that I found a good
stash of Atari-produced material!

Me and hima re working on a cartridge based solution as Falcons don't have
the DMA port and we've worked out it should be faster too. I want to see
Mintnet support too, it's a case of finding someone willing to write them.

>I've got most of the layout done, if someone wants proper gerbers. Also

I was going to do a layout, remember if you get them done you can send
them to Thomas and he'llinclude them in the archive. You won't find the
DB19 easily, Farnell don't stock em so not many will. You could try an
IDC crimp on DB25 cut down to 19.

>PS I'm new to the Atari community... do I understand correctly, that this

Mac?? Is this a joke or what? Since a few months I've a Mac G3 with
MacOS 8.6. I wished I never bought that machine. Desktop operations on
the mac is a PITA. A few days ago I installed Mac Link and guess what?
Somehow my whole setup was destroyed.
Everytime I've to install something on the Mac I hold my breath. I
really hates those installers. It copyies all kind of files around your
harddisk. The machine rules you and not otherwise.

whats the max ram u can have on a TT then? Seeing as I've got 2mb ST and
4mb TT ?

By the sounds of talk in this thread, I'm guessing that I may need to
dump the (?) TTram and buy a new upgrade of TTram????
Actually, I've never opened my TT so I don't know how the ram is placed
- motherboard, upgrade, whatever.. I should take a look before calling
somewhere like Atari Workshop..hmm

Taskbar users can always launch programs with just a shortcut even from
inside another prg. You only need to use clocky.
I only see any benifite for Mac/MagicMac users. This way they can work
with MagiCMac just as they are used to worked with Mac.

I just received the Eclipse today after waiting for a month. Everything went smooth other than the drivers provided with it. They were ver. 0.952Beta I believe. They wouldn't work at all so I downloaded the latest Beta of the website. It now works fine and is amazingly fast. The TT with Crazy Dots that I had before doesn't even compare. It looks perfect under TOS but running Magic6.1 and Jinnee 2.5 causes the icons not to display properly. Are there any Eclipse users running Magic and Jinnee? Could you please tell me how you have yours set? ie. version, fvdi.sys etc... Thanks.

Joshua

Not properly in what way?
I am aware of a colour problem with icons under Jinnee, but have
unfortunately not yet been able to figure out why this happens.

MagiC also doesn't seem to like the caching of the AES background buffer
that fVDI can do, which is a pity since it speeds up menus and some
dialogs a lot.

It's been a while since I did any major work on fVDI, but I'm just about
to get back into it. A revision of the vr_trn_fm code which is now half
finished may turn out to help with the icon problems (I'm hoping so).

>Are there any Eclipse users running Magic and Jinnee? Could you please tell
>me how you have yours set? ie. version, fvdi.sys etc... Thanks.

The most important settings can be changed on the fly with the latest
versions of fVDI and the ACC, but it's not exactly simple to do (and I
don't believe I've documented it anywhere).

As someone said here a while back, it might be a good idea to have some
kind of forum for Eclipse owners.
I used to run a whole bunch of mailing lists myself, but when I changed
jobs I lost easy access to the computer that ran them (my WWW/ftp site is
still there, which is the main reason why I seldom update it these days).
A couple of weeks ago, I finally got a decent (0.75/2.5 Mbit/s ADSL)
Internet connection at home, however, and once I get my computers sorted
out I'll move the web pages and ftp server here. I'll then also be able
to run a mailing list, if there is interest.

No, he is right. I worked with a CLI on a non UNIX mainframe for years.
CLI's can be made better then the current UNIX CLI's.
The one I used was a subset of Algol 68.

To overcome the Y2k bug in XBOOT you can use an editor to correct the
'SETS.DAT' file. To start or edit a new set change the date with the
Control Panel to a date back in time to 1999. make up your new set and
save it. You can now load the .DAT file into an editor and change the
dates of the enteries (following the format) and save. I just change them
to a date in '99 and so far all has worked well.

I made it, this is not easy and had some problems.
-First, not all 4Mb ram works(tt-ram boot test fail). I had to change
resistors RP102 and RP101 downto 22ohms. I also had to change burst
mode to standard mode because Atari use some specials kind of ram for
burst mode.
-Second, some programs bomb. Trying to copy a big file from a
partition to another bomb all times. No solution at this time.

In futur(long time :-)):
- I think to change again RP102 and RP101 for lower value.
- Try to add buffer(74HCxxx)?
- make another board with same electronic with 32 bits sim and buffer?
Very difficult because of double side and metal holes.

If you don't understand my bad english, i can write you in french :-)

Hi there

Thanks for the quick response. The icons are just black boxes on the
desktop. The ones in windows are mostly black with other dark colors. Hard
to explain. I took a look at the ACC but didn't quite figure out how to use
it yet. A forum for Eclipse users sounds great since there are quite a few
of us allready. You're doing a great job with the drivers. Keep it up.

Joshua.

> that "put a sock in it" is the right expression?

I first noticed the advert in December last year in csast. I asked further in csast in January and Barrie made it clear exactly what was involved in open conference. I sent my cheque on 8/2 and it was cashed 20/2 long after I'd received the product even though he said he'd have to await clearance.

The product *is* standard Atari gear - just intended for the spanish market. It doesn't take much to realise that what is being said is that it isn't a frigged PC keyboard such as has been offered by others in the past.

What part of this are you confused by? Anyone vaguely interested in the product will ask the obvious questions. I was even prompted over the fact that the MSTe keyboard I got was a slightly different shade to the TT itself. There was no variation that wasn't made abundantly clear before the transaction was completed. Nothing was hidden and no intention to deceive whatsoever, except in your own imaginings.

>> I am completely fed up with the vendetta you and Steve are
>> perpetuating based on one problem, whose validity seems to be a
>> matter of conjecture depending on who you chose to believe.
> Oh boohoo hoo...

Your point being what? That you have no interest that your vendetta pisses people off? If so, that says more about your motivations than it does about anything else. ISTM you feel compelled to defend yourself long after you should have withdrawn in silence. Please don't feel you have to get the last word - it's entirely unnecessary.

>> Recently I bought further hardware product from them that didn't
>> work. They're hardly perfect. I could name a multitude of other
>> products from other suppliers too. Would that make you happy?
> I'm not interested at all in your dealings with SysSol...

Frankly, neither am I. I get on very well with El and the fault lies as much with my judgement as it does with the product supplied. I'll resolve any problem I have amicably, as I have with any supplier. One method I won't use is your own choice of "grizzling by proxy" in here.

> Think very carefully before answering this... I might ask to proof
> it (learned this from Barrie).

What on earth is provoking your pettiness toward me, Dennis?

>> I'm fed up of your noise on this subject (feel free to talk about
>> anything and everything else).
> You're making the noise, just like Dave you come here accusing me
> without verifying the facts, when asked when and where I made the
> alleged "noise" he answers fail or as in your pretty example simply
> are false.

Maybe I've missed something, but isn't is true to say you have never personally had any transaction with Barrie? If that's true, how on earth can you possibly say that a transaction I *have* been involved in is less valid than a transaction you've heard about second hand? Your comments are bizarre if you think your interpretations are more factual than my direct experience.

> So you're fed up? It's people like you and Dave that force me to
> add to this thread.

I didn't realise who Barrie was when I first contacted him. When I realised he'd been with Dave at TUS I realised I'd met him some years ago and that he's no "johnny-come-lately" to the scene - quite the opposite. When you say "people like..." I wonder what you can possibly mean...

> Did you really think that posting that your pretty "entirely
> untrue" contribution would have gone unnoticed? If this is the best
> you can do, then you better let this thread end...

If I wanted to be unnoticed I wouldn't have written. However, the prospect of letting the thread end is an option we should all agree with - it was my original plea if you remember... B^<

HI Janez,
I mostly agree with your thoughts, but there are other aspects too.

Anyone who switches to the current mainstream platforms won't do so because they want to run Atari programs for the rest of their days. They will inevitably use the new platform's supported features and software.

However, we did gain for a while because talented programmers who wanted to support the Atari were able to upgrade for their own personal development at the same time as being able to ease a certain amount of guilt for moving over. We've benefited for a long time from software developers who've continued to develop Atari programs via MagicMac in particular even though they've made the commitment to change platforms. I know Thomas Much developed the majority of his software for us using this route and 2B products the same.

I prefer developers not to change platforms, but a lot of the look and feel improvements have been an eclectic mix of the best of Mac and PC brought to our Atari machines.

Hi Robert,

>> that SoundPool still updates CD Recorder Pro... they are one of the
>> very few that are still supporting this platform.
>
>Oh, what is the latest release no of CD Recorder Pro?
The latest version is 3.20.123 dated 16 february 2001...

TBH these updates don't really deserve to be named updates, what SoundPool has done it to implement support for new released writers, but the program itself hasn't changed for years... there isn't much that is missing in the package, except of course for long file name support. I haven't got much hope that this will ever be implemented... :-(

Cheers from Belgium
Dennis

The fact is that Dennis hasn't got a clue about the UK Atari scene and
IMO is the original Betty (Yes John, thanks for the email - Emerdale!
got it now?). His side kick started these abusive threads so
carry on posting your experience and give as good as you get.

BTW has Lai posted recently?
Come on Lai, have you been feeding steve with gossip? (Didn't you
read the notice "DON'T FEED THE ANIMALS")
Has Lai lost the ability to type on behalf of the magazine to this group?
Gutless or gossip? Come on Dennis tell me i'm wrong :-)

Have a nice day Harry,

Dave

TOUGH SHIT CROKER.
YOUR GROUP _MEMBERS_ STARTED IT. OTHERS ARE BOUND TO FOLLOW.

DO YOU LIKE ABUSE?
DO YOU AGREE WITH WHAT THEY HAVE SAID? HAVE THEY BEEN EXPRESSING
YOUR GROUPS OPINION? HAVE THEY BROUGHT YOUR GROUP INTO DISREPUTE?

I DIDN'T SEE _YOU_ TRYING TO STOP TWO OF YOUR GROUPS MEMBERS POSTING ABUSE.

DON'T F****** SHOUT IF YOU DON'T WANT IT BACK

Hi Harry,

Older drives where wired for ST(FM)'s. Look at the STE PIN configuration.
I can't say any more as i'll have to charge for it as i used to be a dealer.
We all know what happens to dealers in this group!

BTW What was the name of the story telling writer who writes for
a certain story telling mag? Was it LIAR?

If you want to know on either then email me at maccdave@btinternet.com

Best regards,

Dave

7003. 386 on Falcon...

Newsgroup: comp.sys.atari.st
Date: 2001-05-31 03:20:26 UTC
From: ab616@chebucto.ns.ca
Message-ID: <9f4d9q$h9b$1@News.Dal.Ca>
Source record: 45537

In an older article I was reading on the Falcon (about the time of its release), it was mentioned that it had a 386 capable socket for DOS co-processing. I was wondering if anyone has used this socket for just that and if so, does a regular 386 chip from a PC (386) simply pop into place?

Thanks...

7004. Re: 386 on Falcon...

Newsgroup: comp.sys.atari.st

There is no socket for a 386 chip. What you mean is the Processor Direct
Slot where you can slide in expansions cards such as a 286 or 386 emulator.

Joshua.

Then it's not the problem I know about since that should only make some
colours come out wrong. Try disabling 'imgcache'.

>to explain. I took a look at the ACC but didn't quite figure out how to use

Unfortunately, some of the buttons in the ACC dialog are still useless. The
latest version does, however, have a text field for entering option settings.
For example, to turn on 'xbiosfix' (if it isn't already), simply enter
xbiosfix
and push the button named 'Enter Option'.
To turn off 'xbiosfix', instead enter
-xbiosfix

The minus sign causes the option to have the opposite of its usual effect.

Not all options are usable this way, since fVDI only looks at some of them
at startup time. The most important should work, though, and I'll make more
of them available later.
I thought I had already made it possible to change driver options, such
as 'imgcache', but apparently I haven't. I'll do that ASAP.

>it yet. A forum for Eclipse users sounds great since there are quite a few

I'll see what I can do. In the mean time, please don't forget that whatever
problems you find won't get fixed unless I'm told about them.

>of us allready. You're doing a great job with the drivers. Keep it up.

Thanks. I will.

Hi all!

Can someone answer this question?

I want to know what the best program is for editting/creating GIF pictures. I especially need to be able to set the transparent background colour.

If it could handle Animated GIF then so much the better, but this is not necessary.

I don't mind if it's commercial or shareware.

Cheers!

James

I've been wracking my brains, but I can't remember how I found it. Might be
worth a look for "Black Scorpion Software".

If it's this printer patch you're looking for, try the iPRN driver that's
been mentioned in this thread.

I've sent you email about your jinnee context-sensitive scripts BTW :-)

You'll most likely get more benefit by upgrading your TTRAM board, unless
you need plenty of STRAM for running say, an Atari laser printer.

Not quite the same thing. I'd say that from the description, it acts more
like StartMeUp. You can call (most) any currently running app. from one of
jinnee's context-sensitive popups, a nice way of calling SMU.

There's also a rather similar-sounding plugin for jinnee called
"Plug'n'pop", but some programming experience is required to expand the
sample script into one that will load and run the selected prog from the
popup.

David helped me a great deal with installing a Reflex graphics card in an
STFM, to the extent of sending me an installation guide detailing the all
the soldering points, especially since he'd long since stopped selling
these cards.

The other Dave seems to have a problem though:

>"Dave" <maccdave@btinternet.com> wrote in message
>news:JAhR6.9$TP2.603@NewsReader...
>> Would this be your groups opinion as the signature implies?

How long have you been reading/contributing to/supporting this newsgroup?

In case it's only recently, it's quite possible that you might be able to
find the relevant thread(s) on Google's Usenet archive. Read and digest, for
you have got the wrong end of the stick entirely.

My sig offers a link to DDP's translation service and accompanies every
message that I write in the Atari newsgroups. It does not mean that my
messages reflect the views of that group or of the CCC, whose pages are at
the same URL. If you want my personal views, then feel free to ask for them
by private email. In fact, I've emailed you (Dave) anyway.

Abusive replies will be ignored.

I assumed you would have an upgradeable TT card, the extra 2 mb
ST ram is there if you need it, e.g. for progs that won't run in TT ram.

I am also the custodian of a TT field service manual......

After reinstalling NVDI I realised why I deleted it from my tools folder.
I did delete it as I thought I wouldn't need it as my printer isn't that
old/slow. I put it in the xtension folder and it did the same but slower!

I tried iPRN and success!

How do I register this? Otherwise I'll just have to remeber to turn off
turbo mode.

Thanks guys!

The TTP supplied with CAB can do this transparancy thing. Drawing
programs could be any and just convert to a gif using Imagecopy or
something similar.

>If it could handle Animated GIF then so much the better, but this is not
>necessary.
>
>I don't mind if it's commercial or shareware.

Papillion can handle animated gifs IIRC? Doing the old website ehh?

You completely underestimate the effort this would take. Are you the one
that will first port Motif? Even accelerated Ataris are really *slow*
compared with machines where software like Netscape, Mozilla, Opera or
whatever runs with a decent speed.

When I had my 386, running Opera and trumpet winsock was quite fine,
in fact, faster than my Falcon and CAB 2.8. I really can't see how a
Hades wouldn't run at a good speed. My Falcon is only a 25Mhz CPU type,
and the 386 was 36Mhz. The 060 is faster than 386 easily and even a 486.
My 486@100Mhz is somewhere around 35Mips, just look at the 060.
And the guys programming on our scene are good at optimising so.....

I agree with the effort though, Opera doesn't distribute source code and
Netscape has been ported but slow. (netscape is bloated compared to Opera
though).

Agreed. And another thing - 1WP will automatically use the Word
Processing mode only for files with a .DOC extender. With others
you have to switch this on after loading.

Here we go again, any chance of digging your knife in.

I've not come across any problems with using external drives on the
STE's. I did come across a problem involving an internal drive not being
compatible with an external one.

iirc the external drive socket is wired in parallel to the internal one!

7032. Jinnee & Eclipse

Newsgroup: comp.sys.atari.st
Date: 2001-05-31 22:38:57 UTC
From: Thomas Jordan <Thomas@thomasrichard.freeserve.co.uk>
Message-ID: <9f6hja$2e9$1@newsg1.svr.pol.co.uk>
Source record: 45462

All

At the moment I am collating details of programs which are compatible with Eclipse.

Has any one else experienced the following with Jinnee.

Currently eclipse is in use with NVDI as a background VDI. on my F30

When used with Jinnee 2.5 it is stable until I try to copy a file. At that point the computer just hangs with the hand icon still moveable. the file is not copied. At this point the computer needs resetting.

Also if used in 16bit mode the icons take on a garish colour scheme.

Eclipse is set up as below

rage.sys mode 1280*768*8@60 pcibios screencahe imagecahe

Do I have to set up the nvdifix ? or is it another switch which I have missed.

Iam aware that the modern applications from ASH use the new NVDI calls.

any feed back will be most welcome.

regards

Thomas

I started with the GE-Soft TTRam board along with just the 2Mb STRam board. An upgrade of the STRam was ridiculously expensive via Brad Korda so I ended up with the AixTT TTRam board with 32Mb. Of course, I've had to adjust most programs to run in TTRam (GD-Flag by Gregor Duchalski or Makefast by Thomas Much will do that).

There's also this message I saved out:

I'm pretty sure Atari Workshop do the AixTT board - amybe they do the MagnumTT as well?

Because I live in Birmingham I grabbed the 72-pin RAM from David Encill of Titan/Cortex. Whatever 16Mb SIMMs he kept for Falcon upgrades worked instantly with the AixTT board.

Hi Rodolphe, I have a HPLJ3P. The manual says:

51 Error There is a beam detection malfunction. Hold down the Alt
key and click the Continue key to resume printing. If the
error persists, service is required.

52 Error There is a scanner malfunction. (As above).

It doesn't sound good for you... B^<
